My cows in 1901 average for 8 cows $106.11. I have gone back instead of going ahead, but it was not my fault. I had bad luck with them. I had hard work to do what I did. Do please let me hear from you through the DAIRYMAN what you think of the yield of ten cows.

Alderley, Wis. J. M. G.

It is not necessary to express an opinion on the above. An average of $102 per cow is large enough to do its own talking, and have an opinion of its own.

COMMON SENSE
Calf Feeder

awarded Gold Medal at Pan-American Exposition. The only Feeder adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. More Common Sense Feeders are in use than all others combined. Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

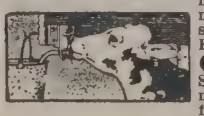
Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

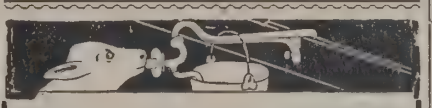
The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of Your Feeder, I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. Be Sure and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.



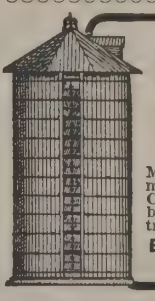
O. H. MANUFACTURING COMPANY, DEPT. H, LYNDON, VERMONT.



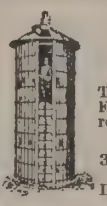
SENT
out under positive guarantee. Money refunded if not satisfactory. No bolting food. Perfect digestion. All tinned—no rust.

KEYSTONE CALF FEEDER
Patented under No. 721,384. Used in about forty experiment stations. Mass. Ag'l College writes as follows: Mr. M. T. Phillips, Dear Sir:—I write to say that the Calf Feeder is giving excellent satisfaction. We have found it to be all one could ask for in a feeder. It is easily cleaned and appears to be durable. Yours truly, E. A. JONES, Supt.
Complete with extra nipple, $1.50, express prepaid. Circulars free.
M. T. PHILLIPS, POMEROY, PA.

DR. REA'S IMPROVED CALF FEEDER
Established 1892.

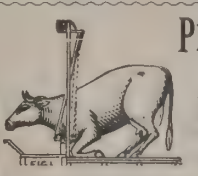


Galvanized castings. Will not rust. Seamless rubber nipples, reinforced, cannot split. Makes fat calves. Price,
ONE DOLLAR.
Satisfaction guaranteed or money refunded. Booklet free.
Dr. CHAS. L. REA, 220 E. 32d St., New York



ONLY BALL AND SOCKET CALF FEEDER on market. Nipple moves freely in any direction as in nature. Many other original features. Not an imitation but most improved feeder made. Result of years practical experience. Approved and used by experiment stations. Easiest to clean, strongest and most durable. Price..... $1.50
or $1.75 prepaid. Free circular tells why this feeder is the best. Write the manufacturers today. MAHLER BROS., 34 La Salle St., Chicago, Ill.

ROUND SILOS. No corners, no angles, hence no moulding, cutting and waste. Cypress, White Pine and White Hemlock. 4 styles; 200 sizes. Best and cheapest Silos on earth. All kinds Silo machinery. Catalog free.
HARDER MFG. CO., Cobleskill, N. Y.



The Economy Silo
Made of selected lumber, by skilled mechanics and special machinery. Continuous hoops—airtight—the best and cheapest. Write for illustrated catalogue and information.

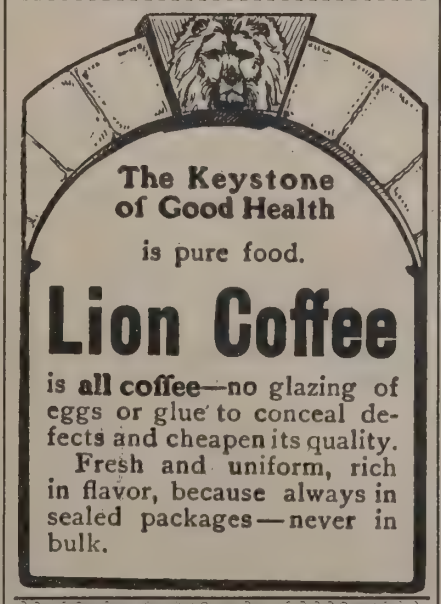
SMITH'S Self-Adjusting Swing Stanchion. The only PRACTICAL swing stanchion invented. Thousands in use. Illustrated Circular free. GLENORA MFG. CO., Glenora Yates Co., N. Y.
Infringements will be prosecuted.

Wilder's Stanchion
—being an improvement over Smith's. Lightest, strongest, quickest, safest swing stanchion made. Has stellated and automatic lock. Becomes stationary when open. Animal cannot turn it in backing out. Made of best seasoned hard wood. Pins for fastening with every stanchion. Send for testimonials.
J. K. WILDER & SONS, Box 811 Monroe, Mich

$28 FREE
FOR A TESTIMONIAL

You can have ripe tomatoes June 15th, ripe melons July 1st, new potatoes and cucumbers May 15th. All other vegetables or flowers as early by using Gold Mine Hot bed. It protects all kinds of plants from frost, cold raw winds and storms. Keeps off the bugs, insects, cutworms. Stimulates plant life in such a manner as to make them grow three times as fast. Indorsed and recommended by every agricultural paper in the United States, and by every farmer that has used them. There is not a Tool or implement that the farmer buys that will bring him in as large returns each year as this. It will pay for itself forty times a year, with proper usage.

We have reduced the price from $1.50 per dozen to 85 cents, for immediate acceptance. Sold on the same guarantee to give satisfaction as plows, binders, and mowers are sold, or money refunded. When you find they are better than you expected them kindly send us a testimonial. Next year you will want more of them; we will reciprocate your kindness with a present.



We will give 200 Gold Mine Hot Beds to the person sending in the best report; 100 for second best; 50 for third; value $28, and pay all charges to destination. Premiums paid in November. Points considered—Earliness yield, amount of money made, with one dozen. Please do not delay your orders.

CONCERNING OUR ADVERTISERS.

About Mower

If a mowing machine never broke until it was worn out, there would not be the large number sold annually that there is at present. Farmers could save expense for themselves and cut down this number if they would take proper care of their machines, keeping the fast running parts properly oiled, the nuts tight, and the various parts in proper adjustment. In buying a new mower, it is well to notice what provision has been made for taking up wear and lost motion and preventing pounding, thus preventing untimely breakage and the early laying aside of the machine. The Champion Draw Cut Mower will repay an examination with this point in mind.

Calves scour and die as the result of incomplete nutrition. Too little protein has been furnished in the food of the pregnant dam; hence the foetus is imperfectly developed. The milk of a dam so fed is similarly lackingin this most requisite ingredient. Armour and Co.'s dried blood meal, advertised elsewhere in this issue, serves to immediately balance the ration of cows and calves—of other females and their offspring—so that these evils do not occur. It is pure dried powdered blood of bullocks, and contains 87 per cent of digestable protein, besides the other necessary and valuable constituents of fresh blood, so that starchy foods may be easily and cheaply balanced by the addition of small quantities of this important product of the packing houses, Working animals are strengthened and invigorated; young growing animals fully nurtured; and sick animals restored to normal weight and health, when fed dried blood meal as an adjunct to their other foods. It has a hundred other important uses. Many of these are set forth simply and truthfully in the booklet published by the Armour Fertilizer Works Readers of this paper will do well to procure a copy of this booklet, which will be sent free of charge. Blood meal will keep poultry healthy, and make hens lay.

The Business Eye.

It requires a business eye to see an opportunity when it presents itself. The ability to see things as they are is the one thing which agriculturists should possess if they mean to make a success out of whatever they undertake to do. It is the power of discernment that enables them to keep up interest in their work, and it is enthusiastic interest in what one is doing that gives life its zest and enables one to do his best. In the purchase of a binder, for example, a good business eye is needed. There are many details in the construction of the machine that should be carefully examined; and where this is done the farmer in the great majority of instances buys the McCormick, because it is preeminently the machine for the man with an eye for business.

The possibility of a dry season should be a factor in the choosing of seed corn. A variety well calculated to resist drouth in the King of the Earlies, grown and marketed by Currie Brothers, the seedmen of Milwaukee, Wis. As will be noticed by their advertisement elsewhere in our paper, it possesses in abundance about every other requirement the planter looks for. In addition to its being an excellent variety, purchasers can always depend on the Currie stock being most carefully selected from the best ears, uniform in type, well matured and without suspicion of having been touched by frost. Prices are quoted in the advertisement. The Currie catalog for 1903 is an inexhaustible mine of good things for the farm and garden. Everything that is standard, many valuable specialties. It is mailed free for the asking.

The readers of Hoard's Dairyman are liberal patrons of the manufacturers of the better grades of wire fencing, not simply that good fencing is a good deal of a necessity on the dairy farm where many fine cows are kept but as well from the fact that Hoard's Dairyman is read by a very progressive, up-to-date class of farmers who succeed by doing things well. With the coming of spring many a rod of new fencing will be put up by our readers and we urge a better acquaintance with those advertised in our columns. It costs but a postal card to obtain an expensive catalogue that fully sets forth the merits of a particular fence and there are advertised in our columns a half a dozen different kinds and they are the best that can be found in the market. Some prefer one, some another, but the way to do is to take a little trouble such as we suggest and find out which you individually prefer. Don't wait until you have expended a hundred or so dollars in new fencing and then wish you had put in some other kind. Satisfy yourself by the opportunity of selection first. It costs no more to have what you want and there is no need of your money buying anything else. Write these advertisers and kindly mention Hoard's Dairyman.

Cure "The" Cow, advertised in our columns, is well spoken of by a reader, as the following correspondence shows:

Nortonville, Kan., Dec. 28, 1902.

Dr. Eaton J. Gróss, 152 Congress St. Troy, N. Y. Dear Sir:—I saw your adv. in Hoard's Dairyman for Cure "The" Cow. I have a cow that is dumpish and stupid, eats very sparingly, and has been that way for the last 4 days. She acts to me like she had lost her cud and looks somewhat bloated; but bowels are open and regular, is dry now and will be in, the first week in January. If you will send me sample of your remedy, I will thoroughly try the same and recommend it to others, as no one keeps cow remedies in this country. I keep 41 cows and there is over 500 right around here. I will let others know if it does what you claim for it. Yours respectfully,

O. J. Langworthy

I shipped Mr. Langworthy, Dec. 30, 1902, ½ gallon $3.50 size Cure "The" Cow free of charge to introduce it in his locality, the following letter will speak for itself:

Nortonville, Kan., Feb. 12, 1903.

Dr.-Eaton J. Gross, 152 Congress St., Troy, N. Y., Dear Sir:—The reason I did not write you sooner is, that about the time I had one cow well, another was affected the same way. One cow is entirely well and the other better. I am more than satisfied with the results of Cure "The" Cow, and shall recommend the same to others here. As soon as sample sent is gone, I shall order more to keep on hand. Very respectfully yours,

O. J. Langworthy.

Rumely Company New Catalog.

From the city of La Porte, Indiana, "the Maple City", comes fresh from the press, the 1903 catalog of our regular advertising patron, the M. Rumely Company. In acknowledgment of the pride all its people have in this enterprising city, it bears on its front cover page a beautiful wreath of Autumn tinted maple leaves, on the back page a cut in colors of the great Rumely manufactory with the leaf embellishment, and the book throughout is attractive in form and substance. It has a fit subject. Its purpose is to illustrate and describe the well known and popular Rumely Traction Engines and Separators. The objects of a catalog are well conceived and maintained to the end. No one can take up the book without being impressed with the fact that the Rumely Company intends that the purchaser shall know all about the Rumely goods. About one-half the book is taken up with full page illustrations. Every point is made plain, so far as illustration can do it, and the descriptions are so minute and exact as to leave no questions or doubts in the mind of the reader when he has finished. The Company evidently proceeds upon the theory that if threshing machinery buyers appreciate just what their line consists of, it will be amply able to take care of itself against all competition. This must be conceded a wise policy where goods have the sterling character possessed by those of this concern. The book will be welcomed by all who are interested in high grade threshing machinery. It will be mailed free to anyone writing for it.

The Dietz Search Light.

The illustration herewith represents one of the search lights manufactured by that famous old lantern house, R. E. Dietz Company, New York. We believe such a light assigned to definite stations in barn or stable would never be parted with after a month's service. The light it sheds is strong and clear, very effectually taking the place of electric light. A definite position should be assigned it on shelf or nail, where it will best command each apartment where work is frequently done at night. It will serve a hundred most valuable purposes, as grooming and harnessing horses, cleaning stables, hitching up and unhitching, milking, feeding, etc. It is also a most valuable, inexpensive light to install in a hall or on the front porch to command the approach to the house. It will be noted that it is fitted for hanging or setting on shelf. It is also conveniently carried from place to place, so that the same light may do duty in the yard and in each of several chosen stations inside. It is one of a long line of lanterns and lamps manufactured by the Dietz Company who advertise in our columns. They will send free their illustrated catalogue to anyone writing for it.

Horace L. Bronson, proprietor of Star Farm Cortland, N. Y., writes: I take pleasure in announcing to readers of Hoard's Dairyman, that I have placed at the head of Star Farm herd, Mercedes Julip's Pietertje Paul. I do not advertise him as the best Holstein bull in the world, for I realize that there must be divergence in opinion as to the respective merits of the best strains of Holstein-Friesians. However, as this bull is now only a yearling and just coming into usefulness, I deem it proper to place his breeding before the public and let it decide as to its merits. His dam is Mercedes Julip's Pietertje No. 39480, and she made a world's official seven-day record in December, 1901, of 29 lbs., 5.7 oz. butter. This cow combines the blood of many of the most noted of Holstein Friesian animals. Pietertje 2nd, holds the world's record for milk with 30,318½ lbs. in one year. Mercedes won the Breeders' Gazette challenge cup in 1883, with a record of 99 lbs., 6½ oz. butter in thirty days, 24 lbs. 6 oz. in seven days, 3 lbs. 10 oz. in one day. Julip was sired by Mink Prince, a son of Mink, record 29 lbs. 5 oz. butter in ten days. In the pedigree of this great cow are the famous bulls, Jaap, Mercedes Prince, Keyes 6th, Pietertje 2nd's Holland King and Mink Prince, so much for the dam. The sire of this young bull is Johanna Rue 2nd's Paul De Kol No. 21724. His breeding is hardly less prominent than that of the dam. Great in breeding, he has already proven

A Good Record

TEN CAR LOADS

which means in this case twenty-four thousand nine hundred tubs sold to one co-operative Dairy Company in Minnesota, between Feb. 1899 and July 1902, and in using them they did not lose one tub out of the entire lot. We have their letter stating this to be a fact.

This is how our GENUINE "Elgin" Tub stands up.

Made only by the ELGIN BUTTER TUB CO. at Elgin, Ill.

Schmidt Bros., Props.

YOU also will have machines suitable for every condition of the harvest field. The Champions have improvements which lighten the work and increase the effective life of the machine.

A catalog describing them and handsome colored calendar will be sent free on request to

CHAMPION DIVISION, INTERNATIONAL HARVESTER COMPANY OF AMERICA, CHICAGO.

WE POINT WITH PRIDE

TO ITS RECORD IN THE SHORT SPACE OF SEVEN MONTHS

—THE—

ILLINOIS COLORADO OIL GAS & COAL COMPANY

HAS MADE A PROFIT OF 500 PER CENT FOR ITS STOCKHOLDERS

on the advanced price of shares. It will fully make 500 per cent more within the next few months. There are only a few more shares to be had at the present selling price - - - - - - - - - - - - - - - - - -

30c A SHARE

If you want any at this price, speak quickly for the drillers of the ILLINOIS COLORADO OIL GAS & COAL COMPANY are working day and night to reach the second large body of oil sands. Following table will show you what you can get for your money. - - - - - - - - - - - - - - - - -

$600 will buy 2,000 shares — **$60 will buy 200 shares**
300 will buy 1,000 shares — **30 will buy 100 shares**
150 will buy 500 shares — **15 will buy 50 shares**

The oil this well has already produced is the highest grade in the United States, and commands a price of $2.00 a barrel. This makes it by far the best investment on the market, for statistics show that this high grade is becoming a scarce product in the United States. Do you appreciate the advantage of owning a product that great corporations are anxious to buy? THE ILLINOIS COLORADO OIL GAS & COAL COMPANY have 1040 acres, room for at least 500 wells, on the line of two railroads. The company owns engines, force pumps, and all machinery necessary to drill to the depth of 3,000 feet, has no indebtedness of any kind, no incumbrance, no preferred stock or bonds. Stock is fully paid and non-assessable. The company is a corporation for the people. Remember the price of shares is now 30c, and as soon as the drills penetrate the vast oil sands the stock will go at $1.00 a share. Without accidents, two weeks will be sufficient to complete our well. Fifty shares is the lowest amount of stock sold. If you cannot pay the full amount of your subscription fn cash, we will accept 25 per cent with order, 25 per cent in 30 days, and 50 per cent in 60 days. THE ILLINOIS OIL GAS & COAL COMPANY is a sure money maker. Don't delay in sending in your order.

10 DAYS FREE TRIAL

We will send any bicycle to any address with the understanding and agreement that you can give it 10 DAYS' FREE TRIAL and if you do not find it easier running, handsomer, stronger, better finished and equipped, more up to date and higher grade than any bicycle you can buy elsewhere at $5.00 to $15.00 more money, you can return it to us at our expense and you will not be out one cent.

$10.95 Buys our new HIGH GRADE 1903 NEWTON BICYCLE, which we guarantee stronger, easier riding, better equipped; better frame, wheels, hubs and bearings than you can get in any other bicycle for less than $20.00. OUR 1903 NAPOLEON BICYCLE is priced at about ONE-HALF the lowest price asked by others. For Free Bicycle Catalogue, hundreds of price surprises in bicycles and supplies, our Free Trial and Guarantee Proposition and our Most Astonishing Offer, cut this ad. out and mail to SEARS, ROEBUCK & CO., CHICAGO

his prepotency. He is the sire of Wit Duchess No. 43953, with an official seven-day butter record of 24.88 lbs., and eight other A. R. O. daughters. His dam is Johanna Rue 2nd, record 21 lbs. 4.5 oz. butter in one week. Granddam, Johanna Rue, record 21 lbs. 3.3 oz. in seven days. The sire of Johanna Rue 2nd's Paul De Kol is Paul Mutual DeKol No. 18726, sire of three A. R. O. daughters. His sire is Paul DeKol, two A. R. O. daughters, his dam, Mutual Friend 2nd., record 27 lbs. 8 oz. butter in seven days official. It would seem as if this breeding would satisfy the requirements of the most exacting. I submit with confidence that no other bull but Mercedes Julip's Pietertje Paul combines the blood of the three great cows, Johanna Rue, Mutual Friend 2nd. and Mercedes Julip's Pietertje. Star Farm has some of the most promising young official butter record heifers that can be found in the country to-day. These have been bred to Mercedes Julip's Pietertje Paul. From the fall increase I shall be able to furnish breeders with male calves, and their breeding will be second to none. The price will be reasonable.

An Ohio Herd Statement.

ED. HOARD'S DAIRYMAN:—Enclosed please find $1.00 for which please send me your valuable paper another year, which I could not think of doing without. Below is statement for year ending Jan. 1, '03; it is not very good, you may print it or throw in waste basket as you like. Hope to do better another year.

Dr.		Cr.	
Invested Jan. 1, '02	$325.62	Milk sold	$ 843 70
Cows bought.....	279.50	Cows & calves..	123.18
Grain and feed....	141.18	Increase (raised)	60.00
Balance.....	762.52	Pres. worth or cost	481.94
	$1,508.82		$1,508.82

This is from an average of 12 cows; have 15 now. In addition to above I have raised about $125.00 worth of hogs; we sell milk and cream, and I am going to try and raise my own cows instead of buying. Cows would sell for more than they cost at present time. I have not made any account of feed raised on farm, only what I had to buy. Cows are natives and grades of Durham and Holstein. I have a Holstein bull and expect to breed up by buying good bulls of a butter strain of Holsteins; I like them very much. Have only been in the business for three years, and can truly say that all I ever knew or have learned, has come from your valuable paper and 3 years keeping cows. R. E. F.

North Kingsville, Ohio.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Infectious Abortion.

My cows are all aborting at from 5 to 8 months. What can I do to prevent it? SUBSCRIBER.
Mass.

ANSWER.

Your cows have infectious abortion and require the strictest adherence to the following instructions in order to free your herd from the dreaded malady which is ruining so many of our valuable dairies and greatly cutting down the annual income to the owners.

We must, first of all, isolate the cows which have aborted; destroy the afterbirth and foetus, and thorougly disinfect the stables in which they have aborted; whitewash the walls and give plenty of light in the stables. About the best agent to apply to the floor is air-slaked lime. Apply it once daily after cleansing, In the absence of lime, wood ashes or land plaster may be used instead. If in the grass season, it is advantageous to put the healthy cows to pasture. The cows which have aborted should not be allowed to retain the afterbirth; the same should be promptly and completely removed, and the uterus and vagina thoroughly cleansed by irrigating same with a 2 per cent solution of carbolic acid, a 1-5000 solution of bichloride of mercury, or other disinfecting agents. This can best be done by using a large sized fountain syringe, and should be repeated once daily, until the disappearance of the vaginal discharge. Until this has entirely disappeared no cow should be used for breeding purpose, or be allowed to be returned into the herd among the healthy cows. We may also increase the power of resistance of all the animals by means of food rich in nitrogen, and a teaspoonful or two of powdered cramp bark in food, once daily.

Swollen Teat.

I have a valuable cow that freshened about two weeks ago. When she came in there seemed to be some obstruction in one of her teats, and it was almost impossible to press any milk out, I opened the passage with a bistoury when a copious flow of milk and blood came. Was able to milk it out for about two days when it became sealed again. I repeated the operation with about same results. Now she has almost ceased to milk from that quarter. Udder is in good condition but the teat is swollen and inflamed. Have bathed it thoroughly twice a day with hot water, then applied a mixture of lard and coal oil. What can I do for her and is there any chance of bringing that quarter to a normal condition.

Which is the cheapest grain to feed with alfalfa; rolled barley, $1.40 per hundred, corn meal, $1.50 bran, $1.40. Will it pay to feed, say 2 quarts per day to each animal? W. J. W.
Riverside, Cal.

ANSWER.

It appears that you have introduced some septic germs into the teat while opening it or afterwards, or the teat would not swell as you state. You cannot be too careful in keeping your bistoury thoroughly aseptic before inserting it. It is advisable to keep on milking even if you get but little milk in order to keep the quarter alive for the next freshening. Otherwise your procedure was all right.

Barley has approximately 78 per cent of feeding units, and corn 84 per cent. There is therefore but little choice between them at the prices named. However we should prefer the barley, and thihk it would pay to feed it.

Brain Affliction.

My bull keeps going around in a circle about his own length. He will keep it up for half an hour, then rest awhile and start again: he always goes to the right, has got no appetite, takes no notice of a cow. J. I.
Chesterfield Co., Va.

ANSWER.

This is an affliction of the brain caused by a parasite which is usually fatal, no matter what you may do.

Hollow Horn.

I have a cow that for two or three days at a time would refuse to eat and then would eat again for a few days and then be off her feed again till at last she went about two weeks. She got extremely poor, and I came to the conclusion she had hollow horns and bored both horns and poured turpentine on top of the head. In two or three days after boring, she began to eat and now eats as much as any cow in the stable, and gained up fairly well in milk, but will not gain in flesh.
Markham, Ont. C. E. C.

ANSWER.

There is no such disease as hollow horns. The cow could not have been very sick if she lived through the treatment you have applied, as boring holes in the horns and pouring in turpentine is surely committing cruelty to the animal. Since she has practically recovered from whatever may have been the trouble, there is nothing to be done, but give her good food and enough of it, also give salt at liberty and she will soon gain in flesh.

Colic During Pregnancy.

I have a valuable brood mare. She is 12 years old; weight 1200 lbs. Three months previous to her foaling time she is subject to what looks very much like colic but as she does not bloat and her bowels seem to be all right I do not think it the genuine colic, but rather think it is her water. In her last case I gave her ½ teacupful mixed with about 50 drops of laudanum turpentine and the result was she lost her colt the 3rd day after the treatment; is doing farm work. Her feed, oats, hay and some grass in season. Would you advise me to breed her again? H. S.
Wayne Co Mich.

ANSWER.

These colicy pains are noticed during certain periods of gestation and had best be left alone unless the attacks are too violent. If any medicine is to be given, an ounce of tincture of ginger will suffice. We believe your remedy was the cause of abortion.

Twin Teats.

I have a calf, three weeks old, that has twin teats in place of one hind teat. Both are perfect and exactly the size of the others and as close together as they can be without being united. Is there any way to remove one of them without injuring the other, or producing any bad results?
Petersburg, Va. R. W. W.

ANSWER.

It will require a personal examination to ascertain whether or not one of the teats can be amputated without injuring the function of the other.

Barrenness.

Have a heifer 14 months old, she comes in heat regular every 21 days, have taken her to the bull three times; yesterday was the last time. She is in fair condition eats well and looks well, seems all right every way only does not get with celf.
Tacoma, Wash. J. C N.

ANSWER

See barrenness, this issue.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe, Speedy, and Positive Cure

The safest, Best BLISTER ever used. Takes the place of all liniaments for mild or severe action. Removes all Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.* Every bottle sold is warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars.
THE LAWRENCE-WILLIAMS CO., Cleveland, O.

Calf Scours Don't let your calves die from this disease. You can save them by using Hood Farm Calf Scour Treatment, which consists of Calf Scour Cure, a liquid preparation which checks the scours, and Digestive Powder, a preparation of pepsin, which aids digestion, creates an appetite and keeps the calf from becoming stunted in growth.

HOOD FARM
Calf Scour Treatment
SAVES THE CALVES.

At Hood Farm, Lowell, Mass., in one year, there were 83 cases of scours. Every calf was treated with these remedies and all but 3 were saved. Formerly we lost 75 per cent. of all calves affected.

Two sizes of each remedy, $1 and $2.50, large contains four times the quantity of the dollar size. Prepaid to any railroad express point in U. S., 25 cents additional.

Address C. I. Hood Co., Lowell, Mass.
Mention this paper.

CHAIN-HANGING CATTLE STANCHION
The Most Practical CATTLE FASTENER ever invented. Manufactured and For sale by O. H. ROBERTSON, Forestville, Conn.

BERKSHIRES. We are breeding Imported boars on Gentry's great Duchess sows, weighing 600 pounds. Our herd is very select, every animal a gem. Satisfaction guaranteed or pigs may be returned.
JOHN WHITE & SON, Adamstown, Md.

LARGE IMPROVED YORKSHIRES
The small York grown up; the best white hog, easy keeping and prolific Young stock for sale.
E. E. STEVENS, R. F. D., No. Madison, Lake Co., O.

ABORTION
Can be successfully treated with Anti-Abortion Serum. Easily administered and permanently cures. Information free.

"SAVE-THE-HORSE" TRADE MARK
SPAVIN CURE

H. A. BAXTER, Real Estate, Insurance, Investments, Great Neck, L. I.

On September 19th., 1902, I procured a bottle of your "Save-the-Horse" for use on a bog spavin which had begun to be very prominent, in fact I believe it to have been about fully developed. The directions for use were adhered to minutely, and before the contents of the bottle were used the spavin was a thing of the past, and today not a sign of spavin or mark of any kind whatever remains. I appreciate the value of this remedy, and it has been my intention to advise you as to the results before, but it has been delayed. Anyone interested and doubtful of this cure (as I admit I was) may write me and I will state just what kind of a case it was, etc. Respectfully,
H. A. BAXTER.

POSITIVELY AND PERMANENTLY CURES bone and bog spavin, ringbone (except low ringbone), curb, thoroughpin, splint, capped hock, shoe boil, weak and sprained tendons and all lameness. $5.00 PER BOTTLE.

Written guarantee with every bottle, constructed to convince and protect you fully. The need of second bottle is almost improbable, except in rarest cases. Guarantee covers effectiveness of one bottle.

Copy of guarantee sent upon application.
$5.00. druggists and dealers, or sent prepaid.
Boston city trade supplied by Sartwell, Heinold & Humphrey, 75 Federal St., EASTERN DRUG COMPANY, Boston and
Troy Chemical Co., Troy, N. Y.
ALSO OF VETERINARY PIXINE, FOR Hoof Rot, Cow Pox, Chapped Teats, and Caked Bag, also Scratches and Grease Heel, cases where ulcerations extend, with traverse cracks which open at every step and often bleed, no matter how complex, aggravated deep seated or chronic; if treated according to directions, as given on circular with every box, positively cured. Keeps the Hoofs Healthy, Soft and in Perfect Form. Heals Collar and Saddle Galls, Abscesses, Sores and all Skin Diseases. 2 oz., 25c.; 8 oz., 50c.; 5 lb. pkg., $4. At all druggists and dealers' or sent prepaid.

COWS RELIEF
Expels the terror of caked bag, the annoyance of sore teats and dread of hard milkers.
Used Exclusively at Model Dairy
Guaranteed to cure caked bag in 12 to 24 hours. Invest 50c and save a cow. Makes milking easy for man and cow. Price, ½ lb 50c, 1½ lb $1.00, postpaid.
O. H. MFG. CO., Dept. H, Lyndon, Vt.

ANTITOXIN
For the Cure and Prevention of Milk Fever.
No quackish humbug but a scientific fact. Works on same principle as antitoxin injection in man for diphtheria, destroying poison in system. Out of 110 cases treated in Portland, Mich., 109 recovered last year. Easily administered with a syringe. Inexpensive. Write for particulars to DR. W. E. A. WYMAN, V. S., Prospect, Ohio.

NOW IS THE TIME TO SUBSCRIBE FOR Hoard's Dairyman.

BLACKLEGOIDS
BEST PREVENTIVE OF BLACKLEG.

Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each Blacklegoid (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. Blacklegoids are sold by druggists; *ask for them.*
Our newly printed eight-page folder on the "Cause and Nature of Blackleg" is of interest to stockmen. Write for it; it is free.

BARREN COWS CURED.
Our treatment has been used successfully since 1878 in every state in America, Canada and Great Britian. Write for Pamphlet.
MOORE BROS., Veterinary Surgeons, Albany, N. Y.

CURE "THE" COW
NO CURE, NO PAY

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of the remedy—$2.00 per quart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address DR. EATON J. GROSS,
153 Congress St., Troy, N. Y.

The Manure Question.

ED. HOARD'S DAIRYMAN:—I have read the pros and cons of the top dressing question in the DAIRYMAN with some indifference because since 1866 I have been familiar with the discussions of Connecticut farmers' conventions, and they quit discussing it years ago. The reasoning of Mr. J. M. Plato seems to be so unanswerable that I am prompted not to try and answer it by any argument, but to give a few facts.

Nearly forty years ago, an old farmer up in Northern Connecticut was showing me through a barn that would hold 40 tons of hay, cattle to eat it and the manure under the cover. He told me the neighbors said the manure would be so handy that he would plow it in for corn and potatoes and spoil his farm. "Not a shovelful of manure," he said, "has ever gone out of that barn to be plowed in." I thought if he read the doings of the "Farmers' Club" in the *New York Tribune* and imbibed the wisdom of Solon Robinson and other wise men, he would know that he had better plow in his manure than spread it on his old side hills. The grass on the old side hills, however, was a wonder to me, and I went home and told my father about it. He said those Litchfield county hills were natural grass land; we couldn't grow grass that way.

A little later on, the farmers' conventions took the matter up for discussion, and I quit plowing in manure with the result that the old farm is quite "natural grass land" now, and will carry more than double the stock that it would when the manure was plowed in. *Per contra*, there are plenty of Connecticut farmers that have never attended a farmers' convention, or read a report of the proceedings, that still plow in manure, but I don't happen to know of a farm where the manure made on the farm, has been relied on to maintain the fertility and that plowed in, that has not continuously decreased in producing capacity, and I know of a farm not half a mile, as the crow flies from my own, that has practically had no hay or grain sold from it in forty years, that will not keep one quarter the stock that the owner's father kept, simply, as I believe, because the father fed his cattle on the meadows and the son put them in the barn and plowed in the manure.

That old system of our fathers, of feeding from a stack and letting the cattle crawl into the corner of a Virginia rail fence for shelter, was cruelty to animals but no one ever heard of meadows running out under that system. Of course there is a reason for this. The good God that made this world and put, in due time, us creatures on it, made a law that the soil that should sustain vegetable and hence animal life should be made and kept fertile by what dropped on the surface. He arranged that the salt should find its way to the sea, but He also provided that the sea should not rob the soil of its chemicals needed for vegetation. "Plato thou reasonest well," but over and over again experiments have shown that nature's law is hard to beat.

Carefully as nature guards fertilizers dropped on the soil, it makes no provision for saving it in a pile. If Mr. Plato doesn't believe this, let him, next winter, haul each alternate load of manure on to his land and put the other in a pile covered or uncovered as he may elect. When his pile is ready to cart, when the frost is all out and the spring rains over, let him spread it over the same space that his fresh manure covered, and watch the result. If he does not find that the longer he leaves his pile the less it is worth, let him report.

One more fact and I have done. While, many years ago, I was still somewhat skeptical as to top dressing I tried a little experiment. Having a hollow nearly a quarter of an acre in extent, that the Editor in chief of the DAIRYMAN may remember as directly in front of the basement of a new barn that he wanted I should board up, for fear my cattle would get too much ventilation in cold nights, I conceived the idea of spreading manure around the rim of this saucer like place. Under the top soil of six or eight inches there is a hundred feet of sand and gravel so that, except when the ground is frozen, there is never any water in the hollow. I took a time when there was a foot of good solid snow on the ground and spread the manure. When the snow melted with the sun and warm rains, there were two feet of water in the middle of the hollow and it was nice and brown. It stayed there till the frost came out of the ground, and then disappeared. I chuckled to think that, while a lot of that fertilizer had got away from where I put it, it had not got away from me. When commercial fertilizers first came into use, in Connecticut, we farmers used to judge of their value by the smell. It took the scientists of the Connecticut Experiment Station quite a while to convince us that the stink was not a fertilizer; neither is color. That two feet of brown water wasn't worth a tinker's damn. The grass grew where I put the manure.

It is possible to put manure on the surface where heavy winter or spring rains will wash it away bodily. A neighbor of mine owns a field just above a meadow of mine and wishing to enrich it he plowed in a lot of manure. We had bad rains the following spring and a ditch was washed in his lot that took soil, manure and all down on to my meadow. Meeting him near the place later on I told him that I wished he would build a dike his side of the stone wall that made the division fence. He inquired why and I told him the grass was getting to lodging so down in the hollow in my meadow that it bothered me to get a machine through it. His reply was "dang ye, I'll come down then next year and cut that grass my self and cast it up where it belongs." He then told me that he plowed in that manure for fear the goodness would leach out and run on to my land. Good turf and grass stubble will possibly let manure run away in a brook but plowing won't help the matter.

Connecticut. R. L. HINMAN.

Capacity of Silo—Length of Carrier.

How many tons of ensilage will a silo hold that is 14 feet in diameter and 22 ft. deep? And how long a carrier will it require to elevate silage in a silo that is sixteen ft. high and the foundation 1 ft. high, silage to go over the rafter plate?

Weyauwega, Wis. W. P. K.

A silo of the dimensions specified, if fully filled, will hold 70 tons of silage, and require a carrier about 25 feet in length for elevating the silage over its top.

"ADVERTISEMENT."

NEVER TOO LATE.

To Try a Good Thing.

I am fifty-two years old and for forty years of that time I have been a chronic catarrh sufferer, says Mr. James Gieshing, of Allegheny City; with every change of weather my head and throat would be stuffed up with catarrhal mucus.

I could not breathe naturally through the nostrils for months together and much of the time I suffered from catarrh of the stomach. Finally my hearing began to fail and I realized something must be done.

I tried inhalers and sprays and salves which gave me temporary relief and my physician advised me to spray or douche with Peroxide of Hydrogen. But the catarrh would speedily return in a few days and I became thoroughly discouraged.

I had always been prejudiced against patent medicine, but as everything else had failed I felt justified in at least making a trial.

Our good old family physician, Dr. Ramsdell, laughed at me a little, but said if I was determined to try patent medicines, he would advise me to begin with Stuart's Catarrh Tablets because he knew what they contained and he had heard of several remarkable cures resulting from their use, and furthermore that they were perfectly safe containing no cocaine or opiates.

The next day I bought a fifty cent box at a drug store, carried it in my pocket, and four or five times a day I would take a tablet; in less than a week I felt a marked improvement which continued, until at this time I am entirely free from any trace of catarrh.

My head is clear, my throat free from irritation, my hearing is as good as it ever was and I feel that I cannot say enough in praise of Stuart's Catarrh Tablets.

These tablets contain extract of Eucalyptus bark, blood root and other valuable antiseptics combined in pleasant tablet form, and it is safe to say that Stuart's Catarrh Tablets are far superior in convenience, safety and effectiveness to the antiquated treatment by inhalers, sprays and douches.

They are sold by druggists everywhere in the United States and Canada.

HARDWOOD TIMBER LANDS

from which the older trees have been cut but mostly covered with a fine growth of young timber, located in Marathon County, Central Wisconsin, are now offered for sale by us on most favorable terms to actual settlers.

This is some of the very best hardwood agricultural land in this state, with a deep, clay loam soil, gently rolling, with water easily obtainable at from 16 to 24 feet.

There is no better land for grain, grasses pastures, oats, peas, fruits or livestock, etc. Particulars will be furnished promptly on application.

Agricultural Education.

ED. HOARD'S DAIRYMAN:—Your very thoughtful and helpful editorial on page 54 of the DAIRYMAN of Feb. 27th, reaches me at a time when my mind is running along the same subject. Thanking you most heartily for these words of encouragement to the boy who loves agriculture, but has limited or no capital and who wishes to find employment from others at fair remuneration, in order that he may some day own land of his own, let me add a few thoughts and statements.

First of all let it be said that any young man who can do a full day's work on a farm, and has a fair common-school education, can greatly improve his earning capacity by pursuing the short course in Agriculture at our Agricultural College here at Madison. Every year we have many hundreds of letters coming to us asking us to recommend some young man from among our students to help on a farm. One writer keeps common cows, farms in a general way and wishes simply a good, steady, farm hand. However, he is willing to pay from $2 to $3 per month more wages to one of our students than he would have to pay to a common hand because he believes he can get that much more service out of such employe. He knows that our Short Course student will usually be more thoughtful and careful in his work, that he knows something about the care and management of cattle, the planting and caring for crops, etc. Now, as it costs a boy somewhat less than $100 to stay with us a single term in the Short Course, it will be seen that the young man is getting a large return from his investment of this small amount of money and time, for the increase in wages is so much clear gain to him,—his clothes and other expenses will be no more for having studied with us than if he had not taken the course

Another class of farmers have pure-bred stock and are carrying on a somewhat higher grade of farming. These men will often pay our students from $3 to $8 per month more wages than they give to common farm hands. They want more intelligence, more skill and more loyalty and zeal. On such farms as this second grade, the young men have an opportunity to increase their knowledge of matters agricultural and enlarge their experience by dealing with pedigreed livestock, the growing of crops in an up-to-date manner and the higher management of the farm generally. Although getting good wages, as the owners of such farms are always willing to pay, these young men are really going to school—the great school of practice—every day they are working. They are combining up-to-date practice with more or less theory and getting a mixture of the two that is to them something as good as gold itself.

When a young man has completed the Short Course and had one or more years experience on such a drill farm as this last, we can usually help him to a still better position if he can show from his employer a satisfactory recommendation of ability, efficiency and loyalty, and if he has completed his work with us in a satisfactory manner.

There are men who own farms which must be managed by others. The owner does not live on the land, or if he does, he is too busy with other duties. He must have a manager to carry most of the burdens for him. Here is a chance for a well trained young man—trained in both theory at the school and practice on the above described farm—to find an outlet for his energies, ability and training at fair compensation. The wages for this class of men ranges from $30 per month and board up to $60 and $75, and in a few cases goes higher. We have many calls for men at $30 and $35 to act as herdsmen, make butter on the farm, etc.

Now, in quoting the above wages I ask the young men who read this article to think of what they would probably get if they offered the same ability, training and faithfulness in some other lines of human effort. These are better wages than they could get with the same ability and preparation as clerks in banks in stores or as teachers in the public schools. Moreover, the frugal young man, who is all the time working for others, if he is wise and farsighted, is gaining a fund of experience which is as good as money itself, and which will prove of the highest use to him when he finally goes into farming on his own account. Such a young man will have learned a thousand things of the most useful character to help him on in successful farming.

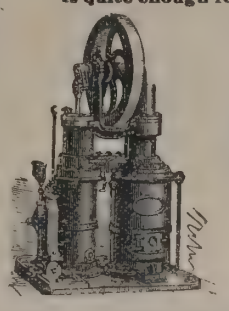
As to the number of calls for young men in these different lines, let me repeat that they are many times our ability to supply. Men are willing to pay for training and expertness in the matter of farm employes, and from our side of the case I am sorry to say that we are not nearly able to supply the demand, nor have we the students of the proper training and mental attitude toward the business. Even with a number of our agricultural students we find them "wanting a job" and hoping that somebody will give them a very large wage, when in turn they are willing to give but very ordinary services. I have had a Short Course student ask me to recommend him for the position of farm manager when he could not show me a single recommendation from a former employer telling that he was efficient and deserved promotion. On the other hand, I am glad to report that a large percentage of our young men have proved themselves worthy of good positions. Here is a case in point. One of Wisconsin's most successful farmers said to me a short time ago: "Professor, the Short Course boy who has been working for me has been receiving $25 per month. You know I have but a small farm and my son is growing up to do the work so that I will not need a helper longer. Now, the young man you sent me is worth more than I am paying him. He is one of the best farm operators I ever saw. I want you to get him a position at larger wages than I am able to pay. I am ready to recommend him, for he is worthy."

Mr. Editor, we soon found a place for this young man and could find places for hundreds if not thousands more. There must be hundreds of young men reading HOARD'S DAIRYMAN that are looking for just such opportunities as have been here pointed out. These young men are hesitating whether to continue life as farm hands or try to get employment on the railways, become school teachers, go into a store, find a place in a bank, or something of that kind. If these young men do not love the country and farm life, then let them go into one or the other vocations. If they are earnest and patient, they will succeed in some fair measure. If however, they love the farm, with its fruits, flowers, cattle and other domestic animals, if they would rather till the soil than do anything else,

STARTLED

By some sudden sound she drops the vase upon the floor. She is nervous and may be told that nervousness is a luxury which only a rich woman can afford to indulge in. Nervousness has cost many a woman her position. Sometimes when women run machinery the price of nervousness is mutilation,—a finger lost or perhaps the whole hand crushed.

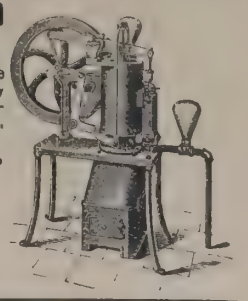
Nervousness in women is commonly but a symptom of womanly disease. It is useless in such cases to "doctor" for the nerves alone. Cure the diseases which attack the delicate womanly organism and nervousness will be cured also.



Dr. Pierce's Favorite Prescription makes weak women strong, sick women well. It establishes regularity, dries weakening drains, heals inflammation and ulceration, and cures female weakness. It tranquilizes the nerves and induces refreshing sleep.

"In the fall of 1897, I was troubled with nervousness, headache, heart trouble and female weakness," writes Miss Blanch M. Bracey, of Sala, Oswego Co., N. Y. "Last summer I wrote you and you advised me to try your 'Favorite Prescription' and 'Golden Medical Discovery.' I did so and I began to improve rapidly. Continued taking the medicine, half a dozen each of 'Favorite Prescription' and 'Golden Medical Discovery' for the space of five months, and in less than a year had regained my former health."

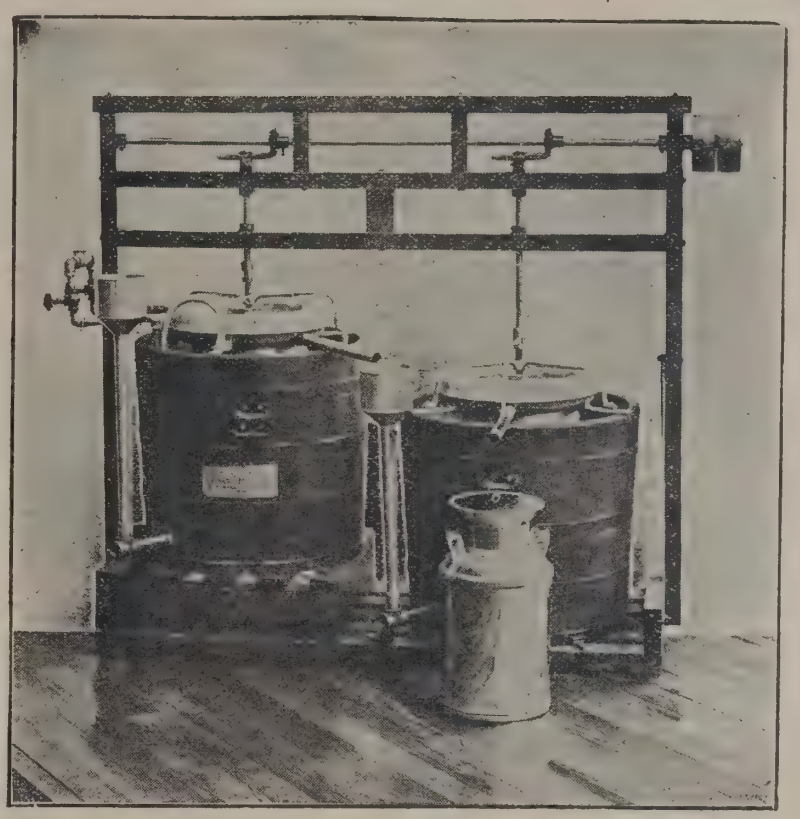
Dr. Pierce's Pleasant Pellets clear the muddy complexion.



HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

RIDER or ERICSSON HOT AIR PUMPS



Are used you can have water every day in the year, and your cook or stable boy is the only engineer needed. 25,000 in daily use. Catalogue "B 5" on application to nearest store.

PROFITABLE COWS

are the ones that will get with calf, that do not abort, and that get through calving easily and safely.

KOW-KURE

(FOR COWS ONLY)

stands for just these things. It's a specific treatment for cow troubles. Not a food; a remedy to mix with food, safe, powerful, sure. Invaluable to dairymen. Dealers sell it. Write us for FREE booklet.

Dairy Ass'n, Lyndonville Vt.

provided that they have fair compensation for so doing, let me say to them, that there is ample opportunity for all their abilities and energies along agricultural lines. They should not forget that the agricultural interests of this country are measured by the investment of twenty billions of dollars; that the products of the farms each year aggregate five billions of dollars. That while in many lines young men are looking for "jobs", there are tens of thousands of land owners looking for high grade, intelligent farm help ranging from ordinary workmen up to those thoroughly skilled in the business. As indicated in your editorial, there are hundreds of men wanting butter makers, herdsmen, foremen and managers.

May I say in closing, Mr. Editor, that I wish no one who reads this communication to write me asking that I recommend him for a position. That is not fair. We can recommend only those who have studied with us, and been tested. I am forced to write these last lines because I am frequently appealed to by entire strangers who are seeking employment.

W. A. HENRY,
Dean, College of Agriculture, University of Wisconsin, Madison.

A Suggestive Letter From Prof. I. P Roberts, of Cornell College.

ED. HOARD'S DAIRYMAN: — I seldom have time to read long articles but I have fully read the article entitled "Cow Census", in your issue of the 13th. This article should certainly arouse your readers to fact that nearly one-half of the cows of your state, and I think of New York State as well, are kept without profit. In the figures given, only the food cost of milk and its product is stated. Nothing is allowed for depreciation of buildings, or of cows, and, above all, nothing for labor. True, this census was taken in a year when cattle foods were exceptionally dear. However, I stand by my statement, that nearly one-half of the cows of the United States are kept at little or no profit and this fact is discouraging, after all that has been said and done, and after your paper, and similar papers, have been showing conclusively that only good cows, intelligently fed, can produce fair profits.

I do not see the slightest indication in the article that a single dairyman visited, had kept any accurate account whatever of the milk produced, of the time expended or of the food consumed. Neither was any estimate made, nor do I believe the dairyman could have made an intelligent estimate as to the total labor cost of keeping the dairy or the cost per cow. With so many of the prime factors left out, how is it possible to ever get at the facts?

You will excuse me for being a little pessimistic at this time. If we could only energize the man, the problem would be largely solved. I have seen one of the changes which are necessary to improve the profits in the dairy and may have laid more stress on this one than on any other "book" knowledge. We now dare use this word. If a man would read HOARD'S DAIRYMAN for one year, and make an honest, persistent effort to follow one-tenth of the valuable information and teaching which it contains, the dairy problem for that man would be largely solved.

And now with the danger that I will be misundertsood, I enclose the title page of a book which will be out of press in a few weeks. I have little or no interest in selling the book, but I do believe if it is studied carefully it will do something towards eliminating the leaks on the farm, and above all, it may help to lift the farmer to a plane where he will have enough knowledge and energy to look after his own business, know at the begining of each year what he is worth, make plans for at least twelve months ahead, and know at the end of that twelve months whether he has received three or thirty cents per hour for his labor. There is no way of finding the losses but to set forth current facts day by day and then gather them together and digest them somewhat in the same manner that Mr. Goodrich practiced in the article referred to. He went from place to place and got facts, set those facts down, then quietly digested and arranged them so that when they appear in your paper they were invaluable.

My wish and hope is that you may be spared many long years to present "book" knowledge in season and out of season to the dairymen of this country that they may be instructed, energized and induced to look after their own business as carefully as manufacturing business must be looked after if it succeeds.

Ithica, N. Y. I. P. ROBERTS.

The book Prof. Roberts alludes to and which has just been issued from his pen, is entitled "The Farmer's Business Hand Book." It prescribes excellent forms for keeping farm accounts, how to take a trial balance sheet, accounts with particular fields, animals, milk accounts, ration accounts and the household account. Part II treats of Rural Law, concering Property, Deeds, Conveyances, Trespass and Water Rights, Drainage, Highways, Contracts, Employer and Employe, Rights, Liens and Notes, Mortgages, Gifts, Wills and Taxes.

Part III. Contains a summing up of valuable knowledge from the last U. S. census. It is an invaluable book for any farmer to own, as indeed are all the books Prof. Roberts has ever written.

DO YOU SHAVE?

If so, don't be satisfied with poor soap. Washing soap, bathing soap, or even the best castile soap will not do. It requires a soap made expressly for the purpose, to soften the beard and allay irritation.

WILLIAMS' SHAVING SOAP

makes a thick, creamy lather and has a soothing and healing effect on the face. Nothing does this like **Williams' Shaving Soap.** The standard for 50 years. **"The only Soap fit for the face."**

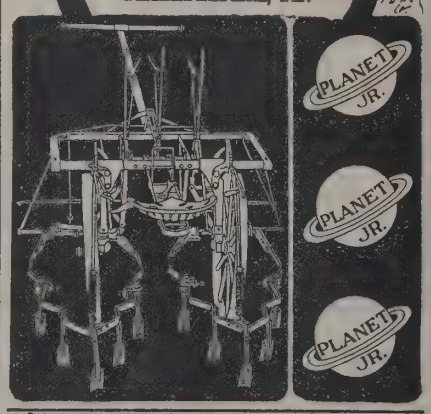
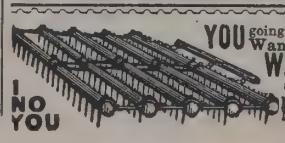
Planet Jr.



The No. 72 "Planet Jr."



Two Row Pivot Wheel Cultivator, Plow, Furrower and Ridger is the sensation for 1903, for with it **one man** with two horses can cultivate perfectly **two rows at one passage** any distance apart from 28 to 44 inches, even if the rows are of irregular width. It has one lever for regulating the depth in front by means of a hinged tongue. The machine can also be balanced so as to suit it to any weight driver and entirely relieve neck pressure on the horses—such an objectionable feature in most sulky cultivators. It has also two levers for regulating separately the depth of the two gangs in the rear, and two for changing the width of each gang separately while in motion, to accommodate the tool to the varying width of the rows. It has our famous pivot axle, which makes it so easy of control by the operator, and it is provided with furrowers and ridgers in addition to the cultivating teeth.

It is a special favorite with potato growers. It is but one of our fifty Seeders and Cultivators, including plain and combined Seed Sowers, Wheel Hoes, Hand Cultivators, Walking Cultivators and One and Two-Horse Riding Cultivators, Special Sugar Beet Tools, etc.

Our new 1903 catalogue contains over 100 pictures and illustrations, with full descriptions and prices. It costs you nothing and will save you money. Write for it.

"ADVERTISEMENT."

THE VALUE OF CHARCOAL.

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered willow charcoal, and other harmless antiseptics in tablet form, or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

A Typical Guernsey Herd.

ED. HOARD'S DAIRYMAN:—I had occasion last fall to go to Perry, N. Y., a beautifully neat little town in Wyoming Co., and while there, visited the Elm Place Farm, and inspected the herd of Guernsey cattle made famous in the last two years by their phenomenal yearly butter records, officially made under the public supervision of a representative of Cornell Agricultural College.

I was very cordially received by Mr. Geo. B. Tallman, the enterprising owner who is an enthusiastic lover of the Guernsey and has great faith in her as a butter cow.

On the farm and under the careful management of Mr. Tallman, while running with a herd of nearly fifty, Portia of Maplehurst 10071, gave in one year 11622.-25 lbs of milk which tested 602.37 lbs. of butter fat, equivalent to 702.7 lbs. churned butter.

Daisy Maid of Elm Place 14197, gave 9045.80 lbs. of milk and 47347 lbs. of butter fat in 3 yr. form; Elite of Maplehurst 8492, gave 9197.35 lbs. of milk and 472.06 lbs. butter; Pride of Maplehurst 10070, gave 9053.70 lbs. of milk and 446.52 lbs. butter fat in one year.

Buttercup of Maplehurst 8994 gave 9127.40 lbs. milk and 446.98 lbs. butter fat. All of the cows named are of the Maplehurst family which Mr. Tallman had the good fortune and good judgment to secure from their breeder, and, I believe, bought the entire family, some 30 individuals. This family has been very closely bred, but shows no sign of weakness of constitution but rather the reverse, being large framed with a rugged constitution and great digestive capacity, turning a large amount of feed with profit into the pail. I was also very much taken with Mentor Maid 13261, who has an official record of 299.9 pounds of milk and 16.02 lbs. of butter fat in 7 days.

Many other good ones I saw there, especially some of the younger cows, but space forbids my giving each one a personal mention, but I cannot pass without mention of the three grand herd bulls the big half of the herd.

Penwyn 4590 comes first as he has more good works to show so far. A massive, low-built fellow, 7 years old, with great digestive capacity, loose mellow hide of beautiful color, large milk veins and good wells, with well placed rudimentary teats. His tail is fine and long, reaching half way from hock to ground.

Disposition perfect, as I do not remember hearing a complaint from him while there. His best recommendation was his daughters in milk. After examining a few of them, one could almost pick them out by their prominent fore udders and large, well placed teats; even the few grades which Mr. Tallman has out of him, showed the same good points to a marked degree.

The Young Glenwood Girl bull, Glenwood Chief 7076, comes next. A very toppy, showy fellow with a fine head and neck so carried as to indicate that he belongs to the aristocracy, with smooth, well made barrel and color superb. A show bull in every particular.

The third bull, Malcolm of Maplehurst 5626, full brother to Portia, plainer to look at, but has, if I mistake not, indications of a sire whose daughters will be phenominal producers, truly the great essential in the dairy cow.

I found Mr. Tallman a business man from tip to toe, but very unassuming; in fact, the brag was entirely left out of his make-up, and in looking over his herd he merely mentioned the names of his cows and occasionally remarked that that one or this one had just recently been admitted to the advanced record. The records of many of the cows I learned from other sources.

Time passed all too quickly and I had to return home, thus ending one of the most pleasant trips of my life.

W. A. ALEXANDER.

Cayuga Co., N. Y.

Size of Manure Shed.

ED. HOARD'S DAIRYMAN:—The shed described on page 1061 of HOARD'S DAIRYMAN'S issue of Jan. 23, 1903, was built for some thirty cows, but is a little small for that number of cows. Should build 24 by 30, or make it a little deeper, say 10 feet. You can then use more litter under cows, or put in more waste straw, etc., from around the barn.

New York. NORMAN BROWN.

RUPTURE CURED while you work. You pay $4 when cured. No cure, no pay. ALEX. SPEIRS, Box 846, Westbrook, Me.

It pays for itself on the first crop grown after its use.

It Spreads Manure,

wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED

Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

Back of the SAMSON Windmill stands the largest Windmill Factory and Company in the World

Annual Capacity of Over 75,000 WINDMILLS.

Think of it, our **Samson** windmills are pumping water in every civilized country in the world. There is a reason for it all. It is because we make the **best.** We use only high-grade materials in construction, and employ only the best skilled labor in manufacturing. Do not confuse our mills with any other mill on the market. They are different—**better.**

The Double Gearing of the Samson Windmill

a feature found on no other, increases its power, and ease of working, lengthens its life, makes it every way superior without increasing its cost. The **Samson's Double Gearing** consists practically of two sets of gearing, or two pinions and two spur gears engaging each other, making two trains to transmit the power of the wheel to the pump. It is fully described and illustrated in our **Free Samson Book.** If you are interested in a mill you should write at once for our handsome new booklet which fully describes our entire line. Sent **FREE** upon request. Address

THE STOVER MANUFACTURING CO., Dept. P, Freeport, Ill.

Grit

Grit is a good thing in its place, but a bad thing in butter. Gritty salt—salt that's icy, insoluble, full of lime, chlorides and magnesium, is accountable for many exasperating difficulties of dairymen. It represents a loss of time, labor, money and patience, not always attributed to it. With DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—your butter difficulties will disappear, and a gain in time, *money* and less labor result. Its dry, pure flakes dissolve quickly, imparting a rich flavor and keeping quality that find ready favor and highest market prices. "Just Salt" is a valuable booklet every dairyman should read. We send it free.

Has stood the test for many years, and users of color know that it can always be relied upon. It is the BEST and therefore the CHEAPEST COLOR on the market.

For Sale By All First-Class Supply Houses.

ANOTHER FOSSIL HURT

BY THE SHARPLES SPECIAL.

A photographic reproduction of the first and only trainload of cream separators ever shipped. A solid train, twenty-four cars of Sharples Tubular Separators shipped from the factory at West Chester, Pa., on February 7th, 1903, that has caused more comment on the growth of the hand separator business, and more bitter feeling on the part of jealous competitors than anything that has occurred since the introduction of the Moody-Sharples system of creamery operation at Nashua, Iowa, several years ago. : : : : : : : : : :

THE ECHOES had scarcely died away after the unearthly howl set up by the antiquated "Disky Valwinkle Munchausen" until the air again resounded with a screech from that amusing old romancer "Ananias Vermont Radish-grater" who it seems was following his friend "Disky" along the track, and so intent upon finding out where he was going that he failed to notice the **Sharples Special** until it had lifted him into the air a sufficient distance to get a better view of the separator situation than he had ever had before. Being a light weight as compared with his friend he staid up longer and had more time to think it over. The dear old fellow tries to cover his sore spots and bravely asserts that he is not hurt,—like unto the small boy who spluttered through his tears, "I'm not crying, this is the way I laugh." Anybody can see that these old fellows are not hurt; it's plain enough from the way they bluster and snort about what they are going to do, how much they have sold (conditionally) to be delivered when (?), where (?) and to whom (?). Oh, no! they're not hurt, they're tickled to death. (?). . . . . .

THE FORCE OF THE ARGUMENT lies in the indisputable fact that there was nothing imaginary or speculative about the SHARPLES SPECIAL TRAIN; it was an immense reality witnessed by hundreds, and evidenced by the records; many of the machines going to former agents of our "has been" competitors, who have learned by experience the advantage of selling an up-to-date, reliable, efficient and attractive separator as compared with a back number, and are therefore selling hundreds of the Sharples Tubulars. Some of our competitors' best agents have asked for the Tubular agency, but we are forced to disappoint them because the territory required is covered by good agents of our own. - - - - - - - - -

We are receiving of late a good many requests for a bundle of copies of HOARD'S DAIRYMAN for distribution. We are very glad to forward copies for distribution, for we need the help of every reader to increase the circulation of the DAIRYMAN. Get up a club of subscribers among your neighbors. If there is going to be a meeting of the creamery or cheese factory patrons, write us for a bundle of sample copies for distribution. If you are going to a farmers' institute, have some copies with you. These meetings afford excellent opportunity to work up a good club. Write us at least a week ahead of the meeting saying how many copies you want and we will promptly forward. Give us your help.

Conditions in Nova Scotia.

ED. HOARD'S DAIRYMAN:—I wrote you some time ago on this subject. I said that the "Credit System" was the curse of Nova Scotia, as it compelled those farmers and dairymen, not wealthy enough to "bide a wee", to barter off their produce for necessaries and concentrated feed, thus paying a very high price for that which they could purchase reasonable for cash. I thought that I made my meaning clear, but in your comment on my letter, you advised the farmers to club together and buy by the carload.

Now, that is exactly what they cannot do, as they (as I mentioned above) have to dispose of their produce for trade and cannot lay their hands on the cash. And even if they could get enough to buy feed for one year, what would they do the next, as it is impossible to get cash for the finished product. But there is ne'er so dark a night but day dawns at last and I believe that that day is now dawning for Nova Scotia in this matter of establishing creameries. The creameries can sell their product where a private dairyman cannot, and by their monthly cash payments are putting the farmer in a position to buy where he can get the best bargain, and as he has the cash the dealers are now very anxious to please him.

I do not at all blame the dealers for not paying cash for dairy butter, as the general run of dairy butter is a very poor article indeed. The dealers pay all that it is worth when they pay within five cents per pound of the creamery article. You may consider that five cents is quite a difference, but that is the exact figure representing the difference, during the past summer, here in Nova Scotia.

Of course there are quite a number yet who prefer to eat very indifferent dairy butter, but that is because their taste has never been educated. I formerly held the opinion (before I entered the creamery business and developed that educated taste) that we had quite a few very fine dairy buttermakers. Now, I find that it is a rare occurance to run across a person who makes good butter in a private dairy.

It will be up hill work to convince the farmers that the creamery is the proper place to dispose of their milk. They have gotten into the way of making butter at home. Their butter is good, etc., and worth as much as the creamery article any day. They consequently feel insulted when you tell them that the creamery stands for improvement all along the line. We find that the men are more willing to send the milk than the women, and for this reason: The women are used to trading at least a part of the butter off for any little necessaries they might happen to need.

Now the monthly milk check is generally cashed by the father or brother who pockets the money and lets the women get along the best they know how. I have merely touched on conditions as they are presented to us, probably if acceptable, I may write further at another time. NOVA SCOTIAN.

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

Dr. Jacob Michaux, Richmond, Va., and **Dr. W. L. Robinson,** Danville Va., Ex-Presidents of the Virginia Medical Society, write as follows: Gentlemen—Having been consulted by you with regard to your "LEA'S MILK AND BUTTER PURIFIER" we beg leave to state after many careful experiments that we are most favorably impressed with its value. From the standpoint of physicians we have no hesitation in saying that the milk from cows to which it is fed is acceptable to the delicate palates and stomachs of the sick in cases where ordinary milk is not borne. We, having a knowledge of the formula, further state that it is not in any way injurious to either the stomachs or systems of the animals to which it is fed, nor to the stomachs or systems of persons using the milk from such animals. We further believe from our knowledge of your preparation that it so favorably influences the digestion of the animal that it will prevent those abnormal fermentations which produce injurious chemical reactions in the secretions and milk of said animals. We advise that Sanitary Dairies be encouraged to use this product, as it furnishes a milk not only devoid of all vegetable and animal odors and flavors so objectionable and so frequently found in milk not thus treated but that it is a sweet and pure article for the table and for the use of invalids. [Signed] JACOB MICHAUX, M. D.

More About Butter Fat Percentages.—Who Shall Set up Ideals as to Cow Types, and What Shall They Be?—Enlightenment the Result of Educational Prepotency.

ED. HOARD'S DAIRYMAN:—In my last letter I referred to the question of the desirable amounts of butter fat that should be aimed for in the milk of the butter cow, and stated that the determination of that question would be largely dependent on the nature of the feed available for the cow. The nature of the feed is the largest influence at work in forming the cow, and hence, in evolutionary work, is potent in creating those anatomical and physiological conditions which more immediately determine the percentage of fat produced. The outside economic conditions, then, are really those which should determine this question of fat percentages in the milk. Under a continuous influence of one set of conditions one type of butter cow will be produced, while a different set of influences will result in another type.

There seems to be a false idea prevalent in some quarters, that a cow will make milk of equal richness, no matter what her feed may be. This is a mistake. In order to enable her fat creating organs to produce a full butter fat percentage, the cow has got to be fed a full supply of fat forming food of a sufficiently digestible nature. There is a physiological limit to the power of these fat creating organs, but a cow can produce but relatively little fat from pure protein, earthy salts and pure water alone. She has got to have a full supply of the other elements as well. Two very much more important questions to the dairyman breeder than this one of fat percentages are:

1st, As to the total milk production that it is best to limit a cow to, at various ages in order to secure the best progeny; and the 2d is, as to the rate with which milk production should be pushed as the animal grows at various stages of her growth.

The two questions are really one. There is a certain class of mercantile breeders who do all they can to secure early large production. The committee of the A. J. C. C., having the question in hand as to the requirements for an advanced registry, have put down as one point, that 6,000 lbs. of milk with the first calf, should be considered as a sufficiently meritorious characteristic to entitle an animal to enter the advanced registry. That is a vice in a Jersey, not a merit. 6,000 lbs. of 2.5 per cent milk is not too much for the first lactation of a cow that would weigh 1,500 lbs. at maturity; but it is entirely too much for a cow that would only weigh 900 lbs. at maturity, and whose milk would test 5.0 on an average.

It is of course understood that the percentages of solids not fat, run somewhat evenly with the butter fat percentages, and the thing that drains the cow's strength in milk production is not the water that goes into the milk pail. The essential matter, which does drain constitutional strength, is mostly that which is composed of nitrogenous and earthy elements. A Holstein cow, because her milk is thin, may be allowed a very much larger flow of milk, so far as weight is concerned, in proportion to her size, than a Jersey or Guernsey, though as to the latter there is in her present stage of evolution very little danger of over-productiveness.

The generally too prevalent practice of pushing for a great early production, I consider as bad for progeny, and bad for inducing persistency of yield. But no one need worry over great butter fat yields in a cow unless there is an exceptionally deep flow of milk, rich in all solids.

This matter opens up a question for the A. J. C. C. to consider. From a scientific point of view it has got to establish, at least, two ideal standards, or else it has got to put down the very large yielding cow of milk containing small or moderate fat percentages as being outside the ideal. I think it had better stick to the ideal cow having large butter percentages, or else put up no ideal at all. What is really wanted is a registry of such information as will allow the individual breeder to use his judgment in carrying on his work. The breed association that in the future is going to give the breeders of that breed the best facilities to do good breeding, is the one whose breed will go to the front, through the production of the greatest number of good cows.

The Pan-American sufficiently demonstrated the fact that there are good individual cows in every breed, though it did not demonstrate the value of breed influence in creating desirable progeny. But so far as securing a real improvement in breeds—an improvement that will be for the benefit of the dairy farmer, I see very little hope from the action of the breed associations themselves. Ideals and demands will have to be set up by outsiders such as dairymen's and farmer's associations and by the state and national stations. I trust, inasmuch as I am not personal in the matter, that I will be pardoned if I say frankly that it seems to me that the various breed associations have fallen into the control of a few who use the associations for pushing the financial interests of a few members of each association, and that these associations do more or less work that is effective in bamboozling the general breeding and dairy public.

This state of affairs may be entirely due to ignorance on the part of those running these asssociations. For charity's sake we will let it go at that.

But there is some ignorance in this world that ought to be fought without gloves, and it is the duty of the stations and other representatives of the dairy public at large to give dairymen such collected information relating to the make up of the right kind of a cow as will call for an intelligent striving to meet the needs of dairymen by breeders. HOARD'S DAIRYMAN ought to be to the fore in this work.

In my own herd, I must say that up to now I have not been able to say that the fat percentages have had any very close relation to the quantity of milk produced. But then I have not had any extraordinary flows. Some of my largest yielders have had the largest percentages of butter fat. Of course the larger percentages of fat the better, so far as profit is concerned, and I shall strive in that direction. The influences which go to produce the large production of fat, are numerous, and are probably not as yet all understood. But so far as I can see, influences which conduce to extraordinary flow of milk, tend to reduce the percentage of fat. There is comparatively little difference so far as good selection of individual cows is concerned in their power to make butter fat economically, no matter what the breed; but there is a big difference so far as general breed influence is concerned. It would also seem that breed influence very considerably differs in power to produce milk solids not fat, although power to digest proteins is one desideration in such animals as make milk containing much cheesy matter.

It seems to me that as we pursue the study of dairyology, we are more and more brought face to face with the fact that recognition of differentiation of type is a necessity for the conducting of dairying in its various specialities in the most successful manner. Every breeder should take up some special line or aim as to type and work to that end. Still there are those who love their dual-purpose cow.

I suppose that there is some occult reason why one should wish that the ignorant dairyman should come to a knowledge of the light. He does come to it whenever the forces of education overcome by main strength the influences which keep him ignorant. The latter are very strong. They include atavistic (hereditary) influence. When one considers the amount of educational work going on in religious, moral, political and civic matters, and notes how slowly those influences reform human nature, we need not wonder that dairy enlightenment does not spread like wild-fire. One of the lessons that it is hard to accept is, that one may be too greedy to be of the greatest good to oneself, and this reflection applies to the matter of expecting an indefinite progression in the profitableness of any kind of cow. One ought not to expect too much of one's neighbor or of one's cow. But it is a safe thing to always keep up a stiff expectancy as to one's own actions for good.

Every dairyman could be made a good dairyman if sufficient influence were brought to bear on him from outside; but for the most part the costs of regenerating the poor dairyman is so great that it will not pay any one to undertake the matter. It is because of this heavy cost that I have lately advocated a consolidated action on the part of Jersey breeders in educating dairymen as to the merits of the right kind of Jersey cows, and here again the difficulty is experienced in securing a change of view. Adults change their methods of thought slowly. There is a physicial reason for it.

Mr. Wheaton's Canadian Dairy Notes.

Output of Cheese—The Coming Season—Fodder Cheese—Butter Markets—Dairy Markets.

ED. HOARD'S DAIRYMAN:—Canada's output of cheese for 1902, when all is marketed, is likely to aggregate in value about $21,000,000. Though the bulk of the make has gone forward to Great Britain, there is still a little on this side of the Atlantic, and until every box is shipped any figures that may be given are not complete.

However, there is so little on hand that statements as to actual shipments so far will be approximately correct. From May 1st, 1902, up to Feb. 18, 1903, there were shipped 2,360,446 boxes, as compared with 2,114,107 boxes for the corresponding period of the season previous, showing the large increase of 246,339 boxes. The value of these shipments will aggregate between $20,000,000 and $21,000,000, or over two-thirds of the total value of the imports of cheese into the United Kingdom, for the same period. This is the largest output in the history of the Canadian cheese trade.

While the make has been the largest in the history of the business, the prices realized by the farmer for his milk have been high. Many a dairyman during September and October, 1902, realized $1.00 per cwt. net, for his milk. Even at the smaller factories, where running expenses are proportionately high, patrons realized 90c and 95c per cwt., the last two months of the making season. There is big money in the business at these figures and the fellow who could not make his cows pay a good profit had better try some other avocation.

Just now both dealer and producer are considering the outlook for the coming season. With a very short supply of old stock and values at a high range, the outlook for the commencement of the season is exceedingly bright. It is reported that contracts have already been made for early fodder cheese at 11¼c and 11½c per lb., or about 2c per lb. lower than what good old stock is selling for.

At these high figures it will take more than moral suasion to prevent factories from opening up early. Other years the trade has been to the front with a strong appeal to factory men not to make early cheese as its inferior quality would injure our reputalion in England. But no such appeal has yet appeared. It looks as if those in the trade were anxious for the factories to get to work at once. The contracts already referred to, and the seeming anxiety of many dealers to do business indicate that such is their view.

This keeping of the fodder cheese "bugbear" in the background at this time, may be taken as proof that the judgment of the cheese trade on this point is not to be trusted and that they advise making early fodder cheese or not according as it suits market conditions, without any regard to the bad effect the sending forward of a large quantity of inferior stuff will have on the markets later on. If it is bad for the industry to export this inferior fodder stuff one season, why it is not another season? This is the question the producer is asking, and he is becoming more and more inclined to trust his own judgment in the matter and let the trade "go hang."

Looked at from a totally disinterested standpoint the less early fodder cheese put upon the English market the better, whether the price be high or low. Any large quantity sent forward will surely injure the sale of the better quality later on. It would be better to keep the winter creameries running longer and convert the raw product into butter.

When the raising of the calves and the young stock on the farm is taken into account, the farmer will, in our opinion, be money in pocket if he makes butter instead of cheese during March and April, and has the skim milk at home for feeding purposes. Let the farmer figure this out for himself and he will find our contention about right even in this year of high prices for cheese.

The butter market at the moment is not of such a buoyant character as that for cheese. The export trade has not been the most satisfactory of late. Creameries have, as a rule, found it more profitable to sell to the local trade. Some lots of new milk butter have already appeared, selling at from 20c to 22c, a fair price considering the somewhat unsatisfactory condition of the export trade.

There is always a good demand for finest quality, which every dairyman should aim to turn out.

To keep in touch with all that is going on in the Canadian dairy world, one must go farther afield than was necessary five or ten years back, when Ontario and Quebec contained all that was worth noticing in connection with the industry. To-day, dairying in all the provinces must be reckoned with. Each has its dairy organization and government oversight, to a greater or less degree, over the industry. In fact, many of the provinces, where the industry is comparatively new, profiting by the experience of the older sections, have more up-to-date methods of giving instruction and helping the patron and maker, than those where dairying had its beginning.

This was shown very clearly at the dairy conference at Ottawa, last April, when the instructors from each of the provinces outlined their methods of work. There is no notice yet of a repetition of this conference this year. It is to be hoped, however, that another conference will take place.

The Quebec dairymen from all reports, held one of the best conventions of the year a few weeks ago. Both makers and patrons were present by the hundreds. Though the proceedings were in French, the information imparted was none the less valuable on that account.

Last year Quebec had 1,012 factories in operation and 47 syndicates. Each syndicate contained from 20 to 25 factories, each in charge of a competent instructor, who visited each of the factories regularly. Ontario dairymen are taking up the syndicate plan, and several are likely to be in operation during 1903. The syndicate plan is the ideal one when uniformity of product and high quality are sought for.

Quebec summer creamery butter leads all others made in Canada, in point of quality. The make has increased rapidly of late years, and that province is nearly as much a butter as a cheese country. Some figures given at the recent convention show how Quebec is forging ahead in dairying. From 1890 to 1900 Ontario increased the value of her dairy output by $7,136,965, while Quebec increased hers by $9,343,371, a balance in favor of the latter of $2,206,406. The people of Quebec have good reason to be proud of the splendid showing they have made.

The output of the five creameries in British Columbia last year was 700,000 lbs. This is not a bad record for a new province, having less than 6,000 farms containing 5 acres and upwards. The British Columbia Dairy Association the last year or two has been giving more attention to bringing in improved stock than to practical dairying. At the annual convention held early last month, it was decided, however, to give more attention in the future to the manufacturers' side of the business. The Pacific province should be in a position to supply its local trade with butter. This it is not doing at the present time, so there is plenty of room for the Association and its members to do effective work in the next few years.

The latest is Algoma. Reports from the district around Sault Ste Marie indicate that this section of Ontario offers special inducements for profitable dairying. The weather is cool, the pastures are rich and succulent and good water is plentiful. More than this there is plenty of timber and stone for building stables and such like.

And so the industry is widening out and keeping pace with the pioneer in building up the newer portions of this great Dominion. J. W. WHEATON.

Toronto, Canada.

Cedar Hill Jersey Farm Notes.

ED. HOARD'S DAIRYMAN:—When I found my name on the program of the Wisconsin State Dairymen's Association Convention I looked forward with pleasure to meeting many old friends and making new ones. In both of these I was not disappointed, but the old feeling of being away from my old home and native state is stronger than ever. When I was a young man I owned a piece of land in Sheboygan Co. in same township our friend Hyatt lives in. This was not good enough for me, so I sold it and went to Kansas where I not only lost the price of the land, but also a dozen years of my young manhood.

The paper read by Mr. Fred Rietbrock of Milwaukee, on the Possibilities of Dairying in Northern Wisconsin, was of great interest to me as I am watching the development of the cheap lands in my native state, and may some day own a home there again. All of my relatives on my father's side are living in Wisconsin and have every since the early forties. I would like to correspond with people who are in the cheap-land sections in Wisconsin.

Come to think of it I do own an interest in some Wisconsin land and may look forward to occupying it some time. This land is in the beautiful Forest Home Cemetery in Milwaukee county. My father was laid to rest there in 1856.

***

Last week we sold some condensed skim milk, $450 worth. We find that condensing skim milk is one of the most profitable side lines of our farming operations. The condensed product is in form of Berkshire pork, 24 June pigs weighed 6500 lbs. Last fall we sold 20 hogs, average weight, 303 lbs. at 6 cents. We yet have 22 head that easily weigh 250 lbs. each. I was in the dairy county of Walworth, Wisconsin on my recent trip and found the dairymen who were patronizing creameries, kicking because they had to pay 10 cents per can for skim milk. I would kick if I had to sell ours for 50 cents per hundred pounds. The feeding value is not perhaps 50 cents, but the health of our hogs and the quality also must be considered. I have never lost a hog with cholera, thumps, kidney or other worms, and skim milk, warm and sweet, is the direct cause of our freedom from disease. While our hogs are Berkshires, we have a type distinctly our own, in comparison with the hogs of same breed throughout our county that receive treatment accorded hogs that are barred from milk.

My subject at the recent dairy meeting at Fond du Lac, "How to Keep and Educate Children on Our Farms" is one that I have to use theoretically, in fact, at least in the future, as the family circle is now broken by my oldest son taking charge of a stock farm in Missouri. As we yet have nine children at home we will continue the methods we described at the convention, fitting the three remaining sons for positions on up-to-date farms, either their own or others. The herd manager, our son now 20 years of age, is I think one of the most skillful feeders of dairy cattle in the country and as a calf raiser he has no equal. 74 out of our herd of 80 Jerseys were reared by him.

My last edition of Stock Farm and Dairyman's Hand-book is about exhausted and I am now preparing for the printer a work much larger and I trust fully up-to-date. All I ask is it may be received as heartily as former editions. As usual it will be distributed at cost of publication. BUFF JERSEY.

Monmouth, Ill.

Corn and Cow Peas.

Some time ago I read an article in your paper in regard to siloing corn and peas, the writer saying it was a great success with him and made almost a balanced ration. Please tell me what kind of peas to plant and at what time to plant them after the corn is planted. Could we harvest them without a corn harvester and how near a balanced ration it would make? G. W. W.

Wilmington, Del.

You will find this subject very fully discussed on page 77 of the current volume.

Where Gold Is Thick

The gold is so thick on a Jas. Boss Stiffened Gold Watch Case that it takes the same depth of engraving as a solid gold case, without impairing its wearing quality. A **Boss** Case never wears *thin*.

From the New York Farmer's Institutes.

The Science and Practice of Feeding Animals as Taught at the New York Farmer's Institute by G. W. Cavanaugh and H. E Cook, who also Answered Questions Relating to these Subjects.

ED. HOARD'S DAIRYMAN: — G. W. Cavanaugh, of Cornell University, talked on the Science of Feeding Animals. In connection with this address, he gave the results of the analysis of fertilizers, and cattle foods, which have been made at the experiment stations. They have found that cattle foods especially have been adulterated; oat hulls are mixed with corn meal, and sold for corn and oat feed; corn cobs are ground fine and mixed with wheat bran. The law now requires the dealer in grains to give a guaranteed analysis of his mixed foods. The balanced ration for the animal must first have the protein element, which makes blood and muscle; the carbohydrates, or starch and sugar, make heat and fat; and the ash or mineral part, the bones. The protein can, to an extent, take the place of the carbohydrates, but the carbohydrates cannot take the place of the protein; carbohydrates, which are supplied by corn fodder and timothy hay, are the cheapest and should be used in the right proportion to make up the balanced ration. For each one pound of digestible protein we should have from 5½ to 6½ pounds of carbohydrates.

Prof. Cavanaugh said that the proprietary stock foods, which are sold in small packages for 12 to 50 cents or more per pound, are made up mostly of linseed meal or some kind of wheat feed, common salt, saltpetre, gentian, etc. These stock foods do not cost more than two to four cents per pound, as they are made up and one can buy these ingredients and make his own condition powders or stock foods.

In connection with Prof. Cavanaugh's address, H. E. Cook spoke on the Practice of Feeding Animals. He said the ideal ration should come as near to grass as possible. There is no food for the cow so cheap as corn ensilage to supply the carbohydrates in the ration. Then we should try to grow some protein crops, as oats and peas, clover or alfalfa. We cannot depend on the grass crop every year, because of frequent drouths, but we can generally get a good corn crop. With good corn ensilage and clover, you can have nearly a balanced ration, which can be grown on the farm, so that less grain need be fed. We must learn to grow the most of the food for the cows on the farm, if we are to make a profit in dairy farming.

Instead of purchasing grain to supplement short and dry pastures, grow oats and peas, corn, etc., and alfalfa. One ton of alfalfa hay is nearly equal to one ton of wheat bran, and four to six tons per acre is not a large crop. I would experiment with a small plot; it is worth making the effort, even if you fail. It requires a deep, well drained soil, and lime or ashes in the soil makes it more congenial to alfalfa, which belongs to the clover family. Make a very fine seed bed and sow 30 pounds of seed per acre, alone, with no nurse crop, early in the spring. When the alfalfa is a few inches high, mow it to kill the weeds and then mow it before the blossoms appear. You can generally mow it three times. I would leave the fourth crop on the ground as a protection for the roots in the winter.

In reply to questions, Mr. Cook said the chief value of turnips, mangels and other roots for cows, is their succulence You can get a succulent food much cheaper with the corn ensilage. I cannot afford to raise roots for cows, because I have ensilage. If I did not have ensilage I would raise roots. I would sow 1-3 timothy with red clover, for we are not always sure of a good catch of clover. The best preparation for the corn crop is to grow a good clover sod. If you feed a cow a good ration, you will have very little use for condition powders, or stock foods. A cow very seldom needs medicine if she is well fed.

The following questions were handed in and answered at this meeting:

What is the best feed for eight-week-old pigs to fit them for market as soon as possible?

H. E. Cook: If you have skim milk, feed with it wheat middlings and a little corn meal. The more skim milk you have, the less middlings and more corn meal you can feed. A little powdered charcoal is good for pigs, as it aids digestion.

What breed of cows does the eastern milkman prefer?

Mr. Cook: He wants a cow of good size. Probably the Holstein or Ayrshire, or crosses between the two breeds make the best cows for the milkman.

What about the general-purpose cow?

Mr. Cook: I do not want a general-purpose cow. She should be bred for one purpose. There is no other breed that will make butter fat so cheap as the Jersey and Guernsey, because they have been bred for this purpose.

Shall we raise our cows or buy them?

Mr. Cook: I raise my cows. I can seldom buy good cows.

What proportion of peas would you sow with oats?

Mr. Cook: On rich land I would sow fewer oats, about 1½ bushels to one bushel of peas; on land not very rich, two bushels of oats and one of peas.

How shall we spend the income from the farm above expenses?

Mr. Cook: I prefer to invest my profits in improvements on my farm.

Should manure applied in the fall be plowed under?

Mr. Cook: No, I plow manure under for no crops except corn and potatoes.

Shall we buy commercial fertilizers on the dairy farm?

Mr. Cook: I buy nothing but South Carolina rock. This supplies what the stable manure lacks. Very seldom is nitrogen or potash lacking on the dairy farm where the stable manure is all saved and applied without loss.

How is the best way to get rid of quack grass?

Mr. Cook: Thorough cultivation with the disc harrow; better have quack growing on the land than not anything.

How shall we get rid of weeds in the pasture?

Mr. Cook: Probably the cheapest way is to keep a sufficient number of sheep to eat them down close, and feed the sheep something in the pasture.

Lining a Water Tank with Cement.

I have a square water tank that leaks at the joints. Could I lath up the sides and cement, or would it crack and come off? H. K.

Ducktown, Tenn.

Unless you are so far south that the tank will not freeze up in winter, there would be danger of the cement coming off. If there is no danger of frost, the cement will probably work well if it is put on thick enough, and that can only be determined by experiment.

DROPPED THEM.

Quit the Medicines and Got Well on Grape-Nuts.

Made over on a change of food is rather a fascinating experience. Sounds like fiction, but an employee of the Anaconda Copper Co., of Anaconda, Mont., had just that experience, being cured on Grape-Nuts.

"For several years I was so run down from indigestion and improper foods that I had to resign a $125.00 a month position in Chicago," he says. "I was in such a bad condition that if I stooped over the sour food came boiling up into my throat and out my mouth.

"I lost nine months valuable time, and three of Chicago's best physicians said I must die. I weighed about 140 pounds, which is skeleton weight for me. So I resigned myself to my fate and went home to the country to die. It was there a cousin introduced me to Grape-Nuts and new life. I threw all my medicines away and at the end of two weeks' use of Grape-Nuts had to admit that I had gained 4 pounds. In the next few weeks I ate absolutely nothing but Grape-Nuts and pure rich cream and gained 18 pounds.

"I began to take interest in the events of the world again. From this point my recovery has been rapid and to-day I am physically in the best condition I ever was in my life. I had no trouble to get a position with the Anaconda Copper Mining Co. at a better salary than before.

"This is what Grape-Nuts has done for me. It saved my life, thanks to pure food." Name given by Postum Co., Battle Creek, Mich.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

THE closing paragraph in Mr. Becker's letter in our inquiry columns is a unique compliment. "I got," says he, "from your good farming paper, silo, alfalfa, and, what is better, Guernseys for dairy business."

Evidently Mr. Becker has been reading to good purpose and good profit. We are gratified to believe that his is by no means an exceptional case, but, on the other hand, we are painfully aware that too many readers are not as receptive to the truth as Mr. Becker has been.

A LAWYER'S OPINION OF THE DAIRYMAN.

A great many professional men, lawyers, bankers, merchants, and some preachers, read HOARD'S DAIRYMAN. They are the owners of dairy farms and want the best source of dairy information they can get. Many of them subscribe for several copies of the paper to be sent to their foremen and such hired men as show an intelligent interest in their work. Here is a letter from a New Jersey lawyer:

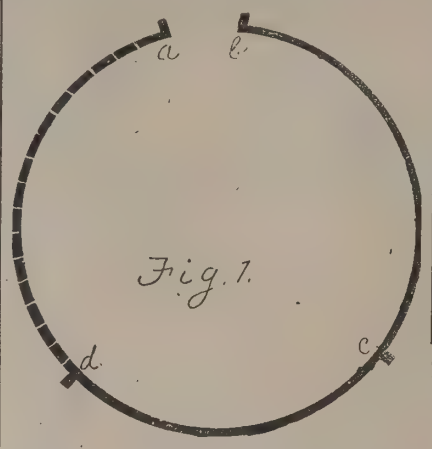
HOARD'S DAIRYMAN

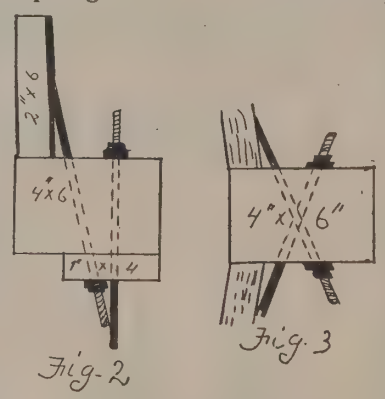
GENTLEMEN:—Through inadvertence my subscription to your paper was allowed to lapse. I take pleasure in reading it. I regard it as one of the best investments I make concerning my farm. It is read, I might say, with avidity, for it is fresh, bright and original, and it brings us of the East into touch with the West and its methods, which are at the head in all that stands for progress.

Patterson, N. J. W. H BELCHER.

THE MODERN STAVE SILO.

We give herewith diagrams descriptive of the method of building a modern stave silo, according to the directions given by Mr. Walter McKeen of Maine, on pages 953 of the preceding volume and 99 of the current volume.





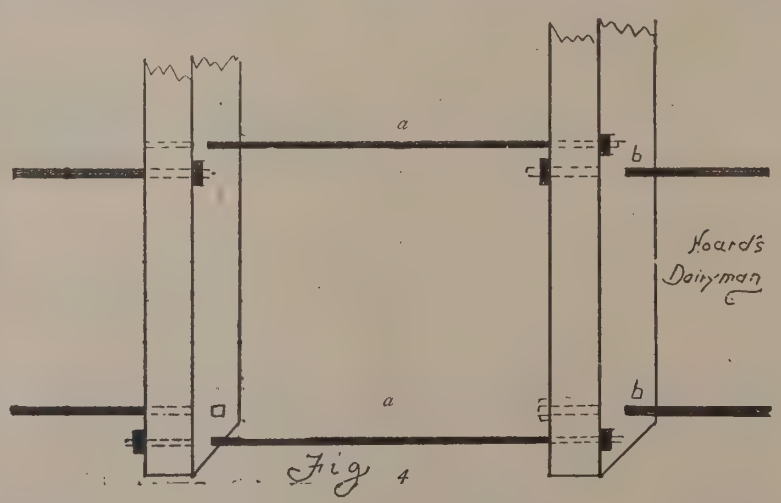


Figure 1 represents a longitudinal cross section of the silo, showing the location or arrangement of the staves and the posts through which the hoops run. The door posts a and b having had a piece 1×4 securely nailed on their inner sides as shown in Fig. 2 to receive the boards for closing the doorway, setting back 2 inches from the inner edge, and having been bored for receiving the main silo hoops and the rods or bolts which tie them together, are framed or otherwise temporarily (but firmly) tied to each other 2½ to 3 feet apart, and the rods or bolts inserted and fastened as shown at a a in Fig. 4, and always closely adjoining the main hoops b b. The distances apart or spacing of these rods and the hoops

will depend upon the height of the silo. For a silo 20 feet high, we would make the lower two spaces not more than 2 feet; the next two spaces, 2½ feet each; the next two, 3½ feet, and the next, or last, space 4 feet.

Observe that the holes for the hoops must be bored diagonally, starting (for the center) about one inch from the line where the outside of the stave will come, and coming out a full inch further away, in order to give room for a large washer and nut, as shown in Figs. 2 and 3.

Set up these posts a and b at the point most convenient for taking out the silage, and see that they are exactly plumb and securely stay-lathed; also set up posts c and d and fasten in place. Now, commence to put up the staves, as nearly as practicable on the circle, until the post c is reached, using old barrel staves, or thin strips of any kind, to hold them in place. Tighten up, say, three of the hoops, reaching from b to c, so as to hold this section in place, and then proceed in like manner with the sections c d and d a. Have the hoops 4 to 6 inches longer than may be apparently necessary, and well threaded back at the ends so that the posts c and d may be moved to accommodate the staves, making the circle a few inches larger, in place of fitting the staves to a specific form.

It is not necessary that all the staves should be exactly of the same width, but none should be more than 6 inches, and narrower would be preferable. It is not necessary that the staves should be beveled or tongued and groved, and some say they need not be jointed or planed. If they are sawed true and of even width throughout, this is doubtless true, but our experience is that lumber is seldom sawed in this manner and we do not advise attempting to build without having the lumber either re-sawed or jointed.

The bottom of a silo may conveniently be four feet lower than the feeding floor of the stable, and the foundation should be at least a foot above the level of the ground. The foundation wall may be made of stone, or concrete, or extra hard brick, and the staves may set back from from the inner edge of the wall 2 to 4 inches. The "regulations" prescribe that only the best quality of Portland cement should be used for plastering the inner surface of the foundation, but the present writer used common water lime, as an experiment, three years ago, and it is still in good order. Put some clay or cement on the inside at the foot of the staves to make sure of a joint impervious to air.

Some sort of a roof or covering is necessary to keep out snow and storms after the feeding of the silage has commenced. This may be cheap and temporary, or more elaborate, expensive and durable.

Cypress is undoubtedly the best lumber for building a stave silo, but any kind of lumber may be used, unless it be elm and basswood.

A LETTER FROM A CANADIAN HIRED MAN.

The Senior editor of the DAIRYMAN confesses to a good deal of interest in that useful class of men who work on the farm by the month. From the time we were sixteen years of age till we were twenty-one, that was the kind of life we led. We look back now with profound respect for one man for whom we labored four years and who did everything in his power to teach us the principles of dairy farming. With him we were trained in the care of 50 cows, the making of butter and cheese, and all matters pertaining to farm work. The following letter from Mr. L. H. Walbridge of Carroll, Manitoba, himself a farm hand, is one which we are proud to receive and print. We only wish that every hired man was actuated by his spirit and intelligence:

ED. HOARD'S DAIRYMAN:—I am leaving here for Melita, Man., April 1st, so you will kindly change the address of my paper. Being but a farm laborer, and very busy, I have not the time to spare to get some subscribers for you. I am sorry for this, as I am firmly convinced of the great value of HOARD'S DAIRYMAN to every man who will read it. I am saving my money to commence farming for myself, so I go where I can get the most money, consequently am here, there and all over.

I believe your paper is of practical benefit to every reader, and more than that, to some who are not readers. For instance, when a hired man by careful perusal and study of your paper, has been stimulated to render better and more skillful service to his employer, surely the employer who has never read the paper is benefited also. I am getting $175 for 7 months commencing April 1st. After that I may go to the United States and work on a dairy farm as I have done before. I can easily spare $1 for HOARD'S DAIRYMAN. Your well wisher,

L. H. WALLBRIDGE.

Melita, Man.

Mr. Wallbridge need have no fear of difficulty in securing a place on a first-class dairy farm, either in the United States or Canada. There are hundreds of first-class dairy farmers who are looking for just such men, to whom they will be glad to pay first-class wages.

COMMENT ON BACK NUMBERS AND THINGS.

That was a good thoughtful article on the manure question by L. C. Burroughs of Pennsylvania, page 62 of Feb, 27th issue. It makes no difference whether his method agrees with our own or not. When a man sits down and writes out of the fullness of good earnest thought and practice it can't help being valuable.

By the way that was an interesting calculation Mr. Burroughs made as to the weight of an acre of green corn stalks. Then besides he told a big truth about the value of sowing rye every fall on stubble land as a cover crop to plow under the next spring. These better ideas and practices are what distinguish an up-to-date farmer who thinks and reads from one of the "go-it-in-the-dark" kind.

Every number of HOARD'S DAIRYMAN contains articles on alfalfa worth ten times its cost to any farmer that has gumption in him. Last week a man came 300 miles to look over our alfalfa fields and note how the cows look that it is fed to. He had accidently got hold of a copy of the DAIRYMAN the week before. He subscribed and says he considers that he is out hundreds of dollars because he has not known of the paper all these past years.

What a difference there is in farmers as well as other men.

Prof. Erf, of the Illinois Agricultural College, and Mr. E.S. Wiggin, of Springfield, Ill., took in the Wisconsin Creamery Butter Makers' Convention at Waukesha, and on their way home paid the DAIRYMAN, the Hoard Creamery and the W. D. Hoard Dairy Farm, a visit. They expressed themselves as very greatly interested in what they saw at the creamery and especially in the stables at the farm. Mr. Wiggin is proprietor of the Leland Hotel at Springfield and operates a large dairy farm in connection therewith. He is a young man of clear sighted ability and energy, and has promised to give our readers some of his experience. Prof. Erf is doing strong, conscientious work among the dairy farmers of Illinois. We hope they will encourage him.

The heartfelt sympathy of HOARD'S DAIRYMAN is felt, if not often expressed, for those good dairy farmers in the New England states who have been wrestling with the foot and mouth disease. That was a brave letter written by Mr. Isaac Alger Jr., of Massachusetts, on page 65. Mr. Alger shows the right spirit, the spirit of hope and pluck. We have a hearty admiration for men who face the "ultimate good," with courage and faith. His description of the character of the disease shows how wise it was for the government to take hold of it with a resolute hand.

OUR cows, the year 1902, gave us good returns, and I give the teachings of the DAIRYMAN credit for part of it at least.—C. W. Pierson, Auburn Center, Pa.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

An Illinois Ration.

Please formulate balanced ration from any or all the following feeds, viz.: Mixed hay, clover and timothy, not very good quality, $8.00 per ton; corn and cob meal, $10.00; old process oil meal, $26.50; bran, $16.25; oats, $20.00 corn fodder, fine quality, B. & W. with large ears. Only small quantity of oats on hand, which I can sell for seed; have written for prices on gluten meal; have also a few hundred pounds soja beans, which I raised myself. I have approximately 20 cows, giving milk at all times; raise some of the most desirable heifer calves on separator skim milk.
Paw Paw, Ill. E. G.

We recommend for trial say, 10 lbs. clover and timothy, 10 lbs. corn fodder, 3 lbs. corn and cob meal, 3 lbs. bran, and 2 lbs. soja beans, or 2 lbs. oil meal. If any cow will eat more of the corn fodder, let her have all she will eat without unnecessary waste. This is the allowance for 24 hours, and we should feed half of the grain at night, and half in the morning, with not less than a teaspoonful of salt with each feed. Cows that have commenced to shrink perceptibly will need less grain, and we would make the first reduction by omitting one-half of the oil meal or soja beans.

Remodeling a Minnesota Barn.

I have a barn 60 feet long, 28 feet wide, with plank floor that is now rotten. I have mangers on each side, built up to the walls with a driveway right through the barn. I have to put in new floor soon; would you advise me to remodel the barn, so as to make it handy? I would like to keep about 25 cows, 6 horses and place for calves; may have to build to it on one side, probably on the north side, so as to get the light and sunshine in from south. J. A.
Minnesota.

Remove the wall from either north or south side and build an addition 9 feet wide. This will give a clear space 33 feet wide and 54 feet long, just enough to comfortably accommodate 26 cows, with passage ways at both ends. Then add enough to the length of the barn, and the full 37 feet in width, to accommodate the horses on one side, and reserve the other side for calf pens, box stalls, and miscellaneous purposes. This will allow feeding alleys, next to the walls on both sides, 5 feet wide; mangers 2 feet wide; standing platform, 4 feet wide; gutters, 18 inches wide; and a central driveway, 8 feet wide. Set the permanent posts, where the wall is taken out, so they will not interfere with the proper apportionment of stalls for the cows.

Rye Does Not Make Satisfactory Silage.

Is there any objection to rye for silage for feeding cows for milk? The milk is used directly as milk and not made into butter. W. R. C.
Philadelphia, Penn.

If rye could be successfully made into silage it could doubtless be fed without tainting the milk, but it is difficult, not to say impossible, to preserve hollow stemmed varieties of forage in a silo.

Frost Killing Young Alfalfa.

Is it considered that frost will kill newly sown alfalfa after it has sprouted, because if so, it is desirable to delay sowing till the spring is farther advanced. I. S. A.
Lower Lake, Cal.

It is well to delay the sowing until the season can be fairly thought to be settled. We have never had any experience in this matter but would judge that the frost would give the young alfalfa plants a discouraging set back.

Timothy and Alfalfa.

We are referred to you by the San Joaquin Ice Co., of Fresno, as the proper person to ask: "What is the relative value of timothy and alfalfa hay as butter fat producers?"
If you are in possession of the information desired, will you kindly favor us with same.
Laton, Cal. N. & S.

There are no *exact* data from the experiment stations, but practical dairymen who have fed both kinds of hay would not exchange one ton of alfalfa for two tons of timothy.

Addition to Barn for Stable.

J. D., Bay City, Mich., has a barn 30 feet wide to which he proposes to add 20 feet in length for a cow stable. This addition must also contain a bin for beet pulp and a hospital (box) stall. He has in mind a narrow central feeding alley, with a row of cows on either side. He also asks if a trap door over the feeding alley at one end will serve the double purpose of ventilation and putting down feed. We have given this problem considerable thought, and do the best we can, there does not appear space for more than seven cows—5 on one side, occupying not less than 16 feet and 2 on the other side, 6 or 7 feet, as the balance of the 20 feet extension will be needed for passage ways and the pulp bin and box stall. Ventilating the stable in the manner proposed is a sure way to make it cold. The exit for foul air should start at or near the floor, in order to draw off the coldest and most impure air.

Which Breed Again.

I would like a little information in regard to dairy cows. I am a young dairyman. Am selling milk at 6 cents per quart, cream at 12 cents per pint. Would like to improve my herd. What breed of cows shall I buy, so as to have good quality as well as quantity? Will it pay me to buy thoroughbred cows? J. F.
Dayton, O.

There will be an interesting and well reasoned communication from our german friend, Schwertfeger next week. He is not altogether an expert in the use of English, but all the same he manages to make his arguments and conclusions understandable. Get the breed you like best, but be careful not to get the scrubs of that breed, and withal do not expect to get first-class quality at a fourth-class price?

We do not think it advisable for any one to invest in a herd of thoroughbreds until he has had some thoroughbred experience. First get the best bull you can buy, and of the breed you prefer, and raise some first-class grades. Frequently, an aged bull, that has proven his prepotency, can be bought for much less than his real value (we bought such an one this winter for $45, because his owner was unwilling to use him longer, having a prejudice against inbreeding). Caring for those grades will prepare the way for giving thoroughbreds proper care. Grow into the business gradually by purchasing, as opportunity offers, here and there, a high class thoroughbred cow.

Virginia Swine Queries.

I would like to get some information about hog raising. In the first place, which of the several breeds do you consider the best? Second, does it pay to winter fall pigs, corn being worth 50 cents, bran $20 per ton? Third, what is the earliest crop that can be planted for hogs in spring? I have a young orchard that I use for hog grazing; what can I plant to have very early feed for them? My sows are due to farrow 1st of March, and want to plant something to suit the pigs. A SUBSCRIBER.
Charlottesville, Va.

1. It is quite beyond our ability to pronounce judgment as to which is the best breed of hogs, or cows, or sheep, or horses.

2. The price of hogs and cattle and butter and cheese usually follows very closely upon the varying prices of feed, and, as a rule, the man who has the courage to feed liberally, when feed stuffs are high in price, receives a good profit.

3. Probably nothing would be better or earlier than oats and peas and a patch of rape.

A Quebec Feeding Inquiry.

1. Am feeding my cows as follows: Bran, 6 lbs.; cotton seed meal, 2 lbs.; turnips, 20 lbs. and all the good mixed hay they will eat. Is that fairly balanced?

2. Have some three-year-old heifers calved the first of the winter and giving on above feed about 20 lbs. milk per day. Would you consider these of sufficient promise to warrant keeping?

3. Have on hand oats at 40 cents and barley at 60 cents. Will it pay to grind these instead of buying bran $22 and cotton seed at $30? What is the comparative values of these feeds? Can buy whole wheat ground at $24 and corn at——
Quebec. SUBSCRIBER.

1. Four to six years ago, with the best information then obtainable, and following the lead of German investigators, the ration described above would have been very generally approved. It carries nearly 2½ lbs. of digestible protein with carbohydrates and fat in substantially the recognized proportions. There are yet plenty of dairymen, and probably a great majority of the professors and instructors in our Agricultural Colleges, who still adhere to these standards, but they are unable to tell us what becomes of this amount of protein. Protein is the most expensive element in food stuffs and the most difficult to provide in farm crops. A line of evidence and reports from experiment stations and careful dairymen, affords us sufficient justification for recommending, at least for trial, a very material reduction in the amount of protein. We should expect practically as good results, if 2 lbs. of ground barley were substituted for the 2 lbs. of cotton seed meal. This would not be a very large saving—less than a cent a day per cow—but it is the aggregate of such small savings that determines whether a dairyman is to be a drudge or a capitalist. Bankers do not scruple to look carefully after the pennies, both of income and outgo, and dairymen should not be so indifferent to the one hundred per cent of profit which follows the saving of each penny.

2. We should consider the present yield of those heifers as promising future dairy efficiency.

3. We cannot see that anything would be gained by substituting either oats or barley for bran at the prices named.

A Vermont Feeding Inquiry.

A. O. K., Bradford, Vt., asks whether cotton seed meal is worth any more pound for pound than corn meal. He is feeding his cows at present 1 bushel of corn silage made from corn fodder without any ears, clover and timothy hay all they will eat up clean, and for concentrates about 3 quarts of mixed feed (bran and middlings) and 3 pints of cotton seed meal daily. Corn meal is worth $23; cotton seed meal, $30, and he wishes to know which is the cheaper feed considering the price of each and under the conditions that obtain with him.

For mere nutritive purposes the corn meal would be the cheaper, but for feeding in connection with silage, clover and timothy hay and the mixed feed mentioned we should prefer the cotton seed meal.

Ration from Corn Fodder and Bran.

Will you kindly give me a ration for new milch cows, weight about 1,000 lbs. I have plenty of corn fodder, in fact the cows now run in a 40 of corn, as it was cut and husked, corn was all in milk when cut; I also have bran of a good quality.
Dodge County, Wis. H. E. K.

Just what may be the feeding value of that "corn fodder" is very uncertain, but it would seem that it ought to be fairly good, if it was well cured and has been well protected. Estimating on such a basis, these fresh cows ought to have from 8 to 10 lbs. of bran daily with salt, and all the corn fodder they will eat. And be careful not to make the too common mistake of estimating a pint of bran as being the same as a pound. There are different qualities of bran, some heavy and some light, but it is not often that a quart of bran weighs to exceed ten ounces. It would require eight quarts of such bran to weigh five pounds.

Ringing A Bull.

Will you please tell me through your columns, what is the proper method of putting ring in a bull's nose. G. S. W.
Unity, Me.

You may send to C. H. Dana, West Lebanon, N. H., for his Bull Nose Punch, price by mail $1.25, or may use a trocar and canula (which is our method), or, in urgent cases, a small, sharp knife will answer, to make the incision. First of all, the animal must be securely fastened and the head so tied that he cannot move it much. Then make the hole, and if the punch is used the end of the ring will press through in the groove; if the trocar is used, withdraw it, leaving the canula projecting, insert the end of the open ring in it and as the canular is taken out the ring will follow. When only a knife is used, push the little finger through the slit, pass one end of the ring close to the end of finger and crowd through as the finger is removed. Bull rings are jointed or hinged, and when closed a small screw holds the parts together.

From Texas.

I have a small dairy of about 25 cows, mixed cattle, some Jerseys, some Durhams and some Holsteins. I want to know what kind of a male would you put with that kind of bunch of cattle to get the best dairy cows. I want quality and quantity also, and furthermore, I have been contemplating selling my whole bunch and getting full blood Jerseys. Would it pay me to do that or not? I sell my milk and butter at home. I don't ship to any creamery. E. K. J.
Stephenville, Tex.

For simple dairy purposes, that is, for the production of milk and butter, we do not think it would be profitable for this inquirer to invest in high-priced thoroughbreds of any breed. Get a sire of the breed personally preferred and that will serve your purposes better than to follow the advice of any other person.

A California Ration.

Enclosed are prices taken from a daily paper in San Franscisco.
Alfalfa hay costs me $13; have plenty of A 1 burr clover hay which is not quoted as it is usually all bought up by dairymen at the ranches. Feed at present as follows: Clover hay about 21 lbs. daily; bran about 6 lbs daily; middlings about 4 lbs. daily; salt about ¼ lb. daily.
Out here most of the dairymen feed the grain wet, would like your idea on same. Please give me a balanced ration from inclosed price list.
Alameda, Cal. F. W. A.

The clipping enclosed with the above communication quoted outside prices for bran, $21; middlings, $27; rolled barley, 26; oil meal, $26.50; cocoanut, meal, $22; corn meal, 31.

We are of the opinion that the ration as fed would give very good results, but thinks that 2 to 3 pounds of the cocoanut meal in place of the middlings would be an improvement.

It is almost the invariable custom in this part of the country to feed the grain portion of the ration without wetting.

A New York Ration.

Please formulate a ration for Jersey cows fresh in January, out of the following: Bran, $23; oats, 40 cents per bushel; cotton seed meal, $30 per ton; brewers grains, $26; oil meal, $30; corn meal, $24; for roughage, clover hay, somewhat damaged by weather. C. E. S.
Moravia, N. Y.

With clover hay for roughage we would select brewers grains and corn meal for concentrates, using three parts of the former to one part of the latter by weight. Let the grains be thoroughly soaked before using.

Cream and Butter Yield.

How many lbs. butter would 831 lbs. cream, testing 29 make? The cream is measured with a pipette same as the whole milk. SUB.
Caldwell, Idaho.

The above amount of cream should make about 287.2 lbs. of butter, according to theory. The actual amount may be above or below this amount, depending on creamery conditions and the accuracy of the testing. Measuring cream for testing with a pipette is not an accurate method and the calculated results may be quite different from the creamery returns.

Wood Hoops and Best Lumber for Silo.

As I am a new subscriber to your paper, I have seen a few sketches speaking of the wooden hoops for silos, but have not seen a description how they are made. As I wish to build a silo next season, I would like all the information I can get along this line. Will you either send me your paper giving a description of the same or give it through the columns of the DAIRYMAN? As I have timber on my own place and saw mills near by, which would you consider best and most durable for building stave silo, red oak, black ash or tamarack? C. O. A.
St. Wendall, Minn.

Direction for making and setting up wooden hoops for a silo will be found on page 153.

There is no reason why the tamarack, if sound and free from shakes, should not make good staves for a silo, and either the oak or ash may be used for the same purpose. We should prefer to have the staves not more than 4 inches wide, but there would be no special objection if they were 6 inches.

A Ration for Cows to Freshen in April.

Will you please formulate for me a balanced ration for a dairy which freshen in April? Cows vary in weight from 700 lbs. to 1,000 lbs. Clover and timothy hay, ground oats and barley (⅔ barley), corn meal, $23.50; Atlas gluten meal, $29.00; bran, $24. Also grain ration for pasture. D. R.
Norwood, N. Y.

We do not deem it advisable to feed full rations to cows immediately after freshening, but prefer to take 15 to 30 days to bring them to the maximum allowance. Subject to this reservation, we suggest for an average ration as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. hay.....	17.06	.96	7.92	.32
5 lbs. oats and barley.	4.45	.45	2.67	.17
3 lbs. Atlas gluten....	2.64	.74	1.16	.34
Totals.....	24.15	2.15	11.75	.83

The smaller cows will probably not require so much of the hay, and only the best milkers the full allowance of grain.

The mixture of oats and barley will be an excellent supplement to pasturage. In addition, give the cows all the hay they will eat. One who has never tried feeding hay when cows are on pasture, will be surprised at the greediness with which they will eat it.

The Babcock Machine.—Good and Poor Cows.

Which is the best the Twentieth Century noiseless hand tester or the Babcock tester?
Also can you tell me what a cow should test to be called a good cow and also a poor cow? What is the average test of a cow? C. H.
Mindoro, Wis.

The above machines are virtually the same machines, differing slightly in construction and material used. Any one of them will be found suitable for doing the work of testing.

The value of a cow depends on the total amount of fat she gives in a year rather than in the richness of her milk. An animal giving 3 per cent milk may yield enough of it in a year to be a valuable animal, while a 5 or 6 per cent cow may give but a relatively small amount of rich milk and be a very poor producer. An animal that will produce 200 pounds of butter a year, just about pays for her feed and it may be taken as a dividing line between the good and poor cows.

Grass Seed for Pastures

I see in last week's paper you advise sowing Red Top, Orchard Grass, Blue Grass, Timothy and Clover for permanent pasture. I wish you would please tell me the quanity per acre of each kind, to make up the above mixture. R. P. K.
Shelburne, N. Y.

The amount of the various grasses to be sown will vary according to the judgment of the sower and locality, but for an average the following will do:

Red top	2 lbs
Orchard grass	5 lbs
Blue grass	5 lbs
Timothy	3 lbs
Clover	3½ lbs

Ropy Milk.

Why does milk get ropy when a couple of days old? Trouble is all with evening's milk. Have a herd of 30 cows, Holsteins, Guernseys, and Holstein and Guernseys mixed. As soon as through milking, milk is stood in water and stands till morning. Morning milk is cooled and all taken and sold. Has the feed anything to do with it?
Dravosburg, Pa. D. B. G.

Ropy milk comes from the introduction of a specific bacterium that causes the milk to become ropy. When once introduced it is very persistent and difficult to get rid of. Everything about the dairy that is used in handling or comes in contact with milk must be scalded with boiling water containing washing soda. This must be done thoroughly, as the ropy bacteria are very hard to get rid of and may have to be repeated two or three times before normal conditions are obtained.

Sixteen Silo Questions.

I mean to build a stave silo this next summer and am getting the stuff now. Have a good offer of some excellent spruce 18 feet long, 2 inches thick and ranging from 4 to 7 inches wide.

1. Is two inches too little to keep it from springing?
2. Also to keep silage from freezing?
3. Is it an advantage to plane the stuff?
4. To tongue and groove it? Shall keep from 10 to 12 cows next year and 3 or 4 calves. Some silage left over would be a help to me, as our pasture in August and later is short and I shall probably keep cows in at night all summer. Later on I hope to keep 16 cows or more.
5. Could I safely build any more than 12 feet in diameter?
6. Should I build 24 feet high or 27 feet?
7. How many tons will silo hold in each case?
8. How much lumber will it take?
9. How many hoops and how far apart?
10. What thickness of iron?
11. Are they better in three sections than in two for tightening?
12. How many doors, what size, and how far from being directly over each other to keep silo strong?
13. Is natural rock cement or Portland the best for foundation for silo and manure shed?
14. How much sand to mix with it?
15. What size stones and how deep the tier of stones below cement?
16. If staves are joined one at top and next one at bottom, will the bottom ones spring out with the pressure?

Sorry to have to ask so much, but I only know what little I have read about silos. Never saw but one and it was a botched job and a failure. Am a new subscriber. E. A. B.
Hatley, Que.

1. Lumber two inches thick is abundantly strong for stave silo.
2. Later experience shows that a little freezing around the outside of the silo is not particularly injurious.
3. We prefer to have the lumber planed, but this is not indispensable.
4. We do not consider tonguing and grooving necessary.
5. For the number of animals kept and to be kept, 12 feet in diameter would be a maximum size.
6. A silo 27 feet in depth is preferable to one 24 feet in depth.
7. Silos of the dimensions indicated will hold respectively 47 and 56 tons.
8. The amount of lumber required will depend altogether on the character of the roof. A very cheap and inexpensive roof will answer every practical purpose, but if one wants to make a more finished building a more expensive roof will be required.
9. A silo 27 feet in depth will require ten to eleven hoops. The four lower hoops should be spaced 2 feet, the next two 2 to 2½ feet and the others from 3 to 4 feet.
10. Round iron ⅝ inches in diameter makes the best hoops.
11. We should prefer to have the hoops in three sections.
12. The doors are placed directly one above the other and preferably plan to have a continuous opening from top bottom. See in this connection the communication from Mr. McKeen on page 99, and the article and illustrations in this issue.
13. Portland cement is uniformly recommended.
14. Consult local masons.
15. For bottom of silo and manure shed lay first a concrete foundation 4 to 6 inches. It is made of one part Portland cement to six parts sharp sand or small stones and over this a cement covering 1 inch thick composed of cement one part to three parts sharp sand.
16. The hoops will prevent springing out of staves.

A Husker for Filling Silo.—Raising Alfalfa Seed.—Dragging Alfalfa to Exterminate White Clover.

I would like to get your advice on filling my silo with a corn husker so as to get the ears in the corn crib. How will ensilage without corn keep? I have 22 acres of alfalfa which I would like to raise seed from. I don't know anything about it in that line. Now I would like to find out whether it can be thrashed with a common grain thresher successfully and how many bushels can be raised to the acre as an average crop. Is it a good plan to drag young alfalfa to get rid of white clover which appeared last fall on alfalfa? Alfalfa is doing very well here.

I must thank you for what I learned from your good farming paper, for I got a silo, alfalfa, and, what is better, Guernseys for dairy business.
Faribault, Minn. N. B.

We do not know of any attachment to a husking machine that will deliver the stover (stalks) in a silo in proper condition. Moreover, there is no place where the grain (corn ears) will keep better or do more good than in the silo. Of course, it is all right to have some corn in the crib, but we would not want to put near all of it there.

Will some one who has had experience with raising and threshing alfalfa seed answer the inquiry on that subject?

We very much doubt whether dragging will kill the white clover, but cannot speak from experience or from knowledge gained from others.

Cows not Doing Well—Silage not the Cause.

I mail you under a separate cover a sample of my silage. My cows are not doing well on it. I am feeding all that they will eat of silage, 5 lbs. of Quaker dairy feed and all the long fodder they will chew up. Please tell me what you think of the silage as to quality. C. H. G.
Middletown, Del.

Sample of silage received, and seems to be of such fair quality that it is impossible to attribute to it the failure of the cows to meet expectations. We should rather expect to find the cause, either in the character of the "long forage" or the quality and amount (if only 5 lbs. per day) of the grain feed used. Without further information on these points, we are unable to offer specific suggestions.

Cheese Making in a Private Dairy.

W. F. W., of Alexandria, Ind., like many other of our readers, inadvertently allowed his subscription to expire, but when the paper stopped coming he missed it so much that he not only renewed for himself but persuaded one of his neighbors also to become a subscriber.

Mr. W. keeps comparatively only a few cows but endeavors to make them pay the expenses of his farm and family so that whatever else he can raise and sell becomes clear profit. For some years he has made cheese in the summer and built up quite a profitable local trade. He asks for some specific information in regard to cheese making and how to handle the cheese while curing so as not to be bothered by the cheese fly. He also wants to know what is the best

"ADVERTISEMENT."

SAY "I'M SICK."

And I Will Supply You With a Cure.

I ask for no money—just a postal; just say that you need help.

I will mail you an order—good at any drug store—for six bottles Dr. Shoop's Restorative. You may take it a month on trial. If it succeeds, the cost is $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

Over half a million sick ones have done what I ask of you; and 39 in each 40 have paid for the treatment gladly, because they were cured.

I don't know your condition, nor how difficult your case. That doesn't matter. If you will make the test, and be fair with yourself and me, I am willing to take the risk.

My success comes from strengthening the inside nerves, which operate the vital organs. I have spent my life in learning how to do it. A weak organ means weak nerve power. It is like a weak engine that needs more steam. To doctor the organ is useless; what it needs is power to act. My Restorative alone brings back that power, and in most of these diseases no other way can cure.

My book will tell you why.

Simply state which book you want, and address Dr. Shoop, Box 934, Racine, Wis.

Book No. 1 on Dyspepsia.
Book No. 2 on the Heart.
Book No. 3 on the Kidneys.
Book No. 4 for Women.
Book No. 5 for Men (sealed)
Book No. 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

A GREAT COMBINATION!

GOOD COWS AND A U.S. SEPARATOR FILL THE FARMER'S POCKETS WITH MONEY!

The U. S. Separator gets all the cream from the milk,
The cream makes the butter,
The skim-milk makes the calf,
All bring in the cash.

kind of cows for cheese. At present his herd consists of Grade Jerseys but he is crossing them with Holstein-Fresians with a view to increasing the yield of milk.

We recommend Mr. W. to send $1.75 to this office and get a copy of Prof. Decker's book on Cheese Making. This work is more adapted for large factories but the same principles obtain whether one is making cheese on a large scale or a small scale, and this book will be found very helpful even in a private cheese dairy.

We have some question whether this inquirer is exactly on the right track in seeking to obtain cows which will give him a larger flow of milk containing a smaller per cent of fat. It must be conceded that 4 per cent milk will not make quite one-third more weight of cheese than 3 per cent milk, but it does make cheese of a better quality. When one is supplying a private local trade, quality is often of more importance than quantity.

The general market does not make as much distinction in quality of cheese as it should, but local home trade does make this distinction and as a rule is quite willing to pay liberally for the best quality of all kinds of farm products.

Silage or Soiling Crops.—Size of Silo.

H. B., Glen Ellyn, Ill., asks which is better, where there is no pasture, to depend upon such soiling crops as rye, oats and peas, clover and corn, or to build a silo. The probabilities are, that neither method exclusively would give best results. For the benefit of the land it is a good plan to sow some fall grain as a winter cover crop and early spring pasturage, and especially to get something to turn under to add humus to the soil. In addition, something must be raised for hay. Cows fed on silage, whether in winter or summer, crave some dry forage, and should have it. Peas and oats make both good silage and good hay. So we say it is not wise to depend exclusively on corn for silage. Then, too, there comes in the question of alfalfa, which is being so fully discussed in our columns from week to week.

H. B. asks what size silo to build, but omits to indicate how many cows or other animals he expects to feed. A very safe proposition is to allow one cubic foot of space per day for each animal.

Silage all the Year.—Molasses—Young Bull.

1. Can I keep cows on silage and the necessary dry feeds with some grain the year round? If so is there a work treating on the same? I have a silo large enough for over half the year now.

2. What is the added value to dried brewers grains that are soaked in the molasses from the sugar factories.

3. How much service is safe to give a Jersey bull ten months old. H.

Holland, Mich.

1. Silage may be fed with quite as much success and in similar manner in summer as in winter. There is no book, known to us, which treats specifically on this subject. The main objection to depending exclusively upon silage for summer feeding, is that it does not work in well with a proper rotation of crops.

2. We are of the opinion that nothing is added to the feeding value of brewers grains for cows by treating them with molasses.

3. None at all.

A Case Where it Would Not Pay to Build a Silo.

Would it pay me to build a silo when I would have to haul the corn or clover two miles to get it to the silo, and not able to make more than three loads a day, each one and half tons in weight.

What is the best cure for scours in a calf nine months old, caused by green grass with too much water in it, or too soft? Blood meal I find to be the very best thing for young calves, but not a sure cure in old calves with a bad case of scours.

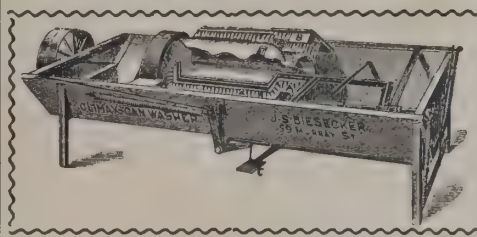
Ross Valley, Cal. M. M.

It would hardly be practicable to fill a silo at the rate suggested, as it would occupy too much time. Possibly by changing work or hiring extra help, the work could be finished in a week or less. A distance of two miles we would not consider an insuperable objection.

The "best cure" for any trouble occasioned by over-eating or eating improper food is to eat less or provide more suitable food. Cases of the character suggested really do not need medicine, but judicious diet. A little scorched flour or other dry feed would tend to allay the effects of the improper food.

"ADVERTISEMENT."

MONEY TO COOKS.



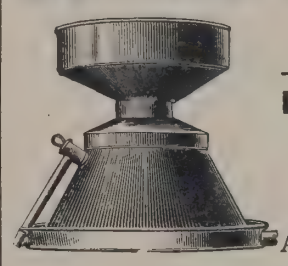
$7,500 00 Donated to be Divided Among Family Cooks.

The sum of $7,500.00 will be distributed between now and midsummer among family cooks, in 735 prizes ranging from $200.00 to $5.00.

This is done to stimulate better cooking in the family kitchen. The contest is open to paid cooks, (drop the name "hired girl" call them cooks if they deserve it) or to the mistress of the household if she does the cooking. The rules for contest are plain and simple. Each of the 735 winners of money prizes will also receive an engraved certificate of merit or diploma as a cook. The diplomas bear the big gilt seal and signature of the most famous food company in the world, The Postum Cereal Co., Ltd., of Battle Creek, Mich., the well known makers of Postum Coffee and Grape-Nuts. Write them and address Cookery Dept., No. 338, for full particulars.

This remarkable contest among cooks to win the money prizes and diplomas will give thousands of families better and more delicious meals as well as cleaner kitchens and a general improvement in the culinary department, for the cooks must show marked skill and betterment in service to win. Great sums of money devoted to such enterprises always result in putting humanity further along on the road to civilization, health, comfort and happiness.

CLIMAX MILK CAN WASHER



A LONG-FELT WANT SUPPLIED.

WHY wash cans in the Creamery by hand when it can be done by steam or other power? The **CLIMAX** washes the can outside as well as inside. It saves time and extra help. An expert can wash 175 cans an hour. It is a money saver for the wide-awake creameryman. Buy one of these machines and you will never regret it. A postal will bring additional information, prices and a copy of our illustrated catalogue. Write today.

I will make you a quotation on anything you want or request.

J. S. BIESECKER, 59 Murray St., New York City

OAKES & BURGER, Cattaraugus, N. Y.

PERFECT FLAVOR IN BUTTER AND CHEESE

results from perfect milk. Perfect milk is that which has been properly handled from the moment it left the cow until it reaches the finished product.

THE PERFECTION MILK COOLER AND AERATOR

makes a perfect milk. It takes out all animal odors and those arising from stables or feed. It retards **loppering** and **souring;** prevents the **cowy odor** in butter and **deleterious gasses** in cheese. City boards of health are insisting on milk that is properly cooled and aerated. This machine is **simple, quick** and **effective.** Made in sizes from 1 to 200 cows. Send for free circulars.

Cornish, Curtis & Greene Mfg. Co.,

Inventors, Manufacturers and Dealers in Everything Pertaining to Butter and Cheese Making.

Agents for.... DE LAVAL ALPHA SEPARATORS.

Fort Atkinson, Wis.

When and how is alfalfa seed secured, harvested and threshed? We invite readers having had experience to reply to Mr. Becker's inquiries, printed in another column.

R. C. Phelps, Westerville, Ohio, sending check for two subscriptions, writes: "The Dairyman is worth many times its cost. We have increased the average per cow $15.00 since taking it."

HE SUBSCRIBES FOR TWO COPIES OF THE DAIRYMAN.

There are quite a number of subscribers on our books who take regularly two or more copies of the Dairyman, one for themselves and the others for their men. We were quite interested at the Fond du Lac Dairy Convention in hearing a friend relate the situation as it existed with him. He is a thorough, up-to-date dairy farmer and employs three men steadily, by the year. His story, as he gave it to us, was about in these words.

We had been talking over the strange difference in the returns and profits of one farmer and another at the same creamery or cheese factory, and I asked him to explain it. "That is easily explained", he said. "One man takes an interest in his business and tries to learn, the other don't. That is all there is about it. One man stimulates his mind with good dairy reading. The other reads nothing and there is a mental deadness in that household all around. I noticed years ago that Hoard's Dairyman was worth four times what it cost in its effect on my men. It made them brighter, more thoughtful and it gave us all something to talk about in our own work. They know more and that makes them feel like doing the best they can. Why, I had to take an extra copy in order to get a chance to read the paper myself when I wanted it. You are on the right track in this question. The farmers need stiring up to see what it is that ails them. It is a lack of live brain work. They are losing thousands upon thousands of dollars, and they don't know it, nor do they know that it is for the lack of better thought and knowledge that they are where they are."

We thought, what a contrast. Here is a man making fine profits in dairying, and taking an extra copy of Hoard's Dairyman for his hired man. His next neighbor working harder, taking milk to the same creamery, getting less money for it than the feed cost, and saying he "wouldn't have the paper in his house if they would give it to him.." What a grudge some do owe themselves. How they set traps for their own feet.

A Kansas Ration.

Ed. Hoard's Dairyman:—I am running a creamery, sheller, feed mill and thresher, all with one boiler. I read your Dairyman with much interest.

Your balanced rations interest me. I want to make a balanced ration for cows, horses and hogs, using the largest quantity of kaffir corn, as it is the most reliable crop and cheapest grain. I now use 3 bushels kaffir corn to one bushel of oats for cows and add one bushel corn for horses and shoats.

I want to grind and mix the feed for our patrons, kaffir corn is worth 30 cents for 56 pounds; corn, 35 cents for 56 pounds; oats, 30 cents for 32 pounds. Patrons like this feed and I want to improve it if I can. J. R. M.

Cedar Vale, Kansas.

A combination of the character indicated should prove satisfactory to dairymen who have alfalfa hay for roughage, but where reliance is mainly upon corn silage, corn stover, timothy and prairie hay, something containing more protein would seem to be demanded. Horses at work would also be better fed, with a grain mixture containing a larger proportion of oats.

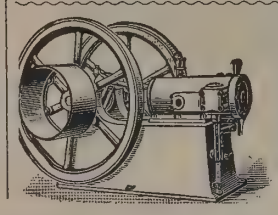
Cow Comfort.

A Question for Mr Brown.

Ed. Hoard's Dairyman:—In this volume of the Dairyman on page 54, I read an article by Norman Brown in which he said: "I want my cows to stand for the 24 hours where the mercury stands at 70°, the water is heated to 80°. All this I can do by a system I can explain and the same system will ventilate the barns perfectly so the air will be pure for the 24 hours at a cost not to exceed 50 cents per cow for the entire winter for 30 cows."

Now I would ask that Mr. Brown explain his system and give it through the columns of the Dairyman for the benefit of his brother farmers who may be planning on improvements.

It is a fact plainly evident in this part the country that the farmer who does not read the agricultural literature of the day finds his place at the rear of the procession, and each year he loses through his wasteful methods many times enough to keep his table supplied with the leading farm papers. H. L. S.



East Dixfield, Me.

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the **"OTTO"** is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our **Volume Governor** gives uniform speed. Our **Acme Mixer** is the most positive and economical on the market. Our **Hand Starting Lever** starts engine with least effort. All bearings of **Phospher Bronze.** Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

J. THOMPSON & SONS MFG. CO., 113 BRIDGE ST., BELOIT, WIS.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"The Master Workman,"** a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Pleas mention this paper. Send for catalogue. **THE TEMPLE PUMP CO.,** Established 1853. **Meagher and 15th St., CHICAGO.**

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4⅛ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all w ll painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self dralnage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

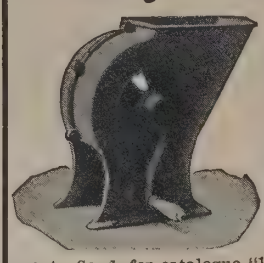
Tell me what you want, I can save you time and money. Bank references. Established 1881. **FRANK P. CLEVELAND, Real Estate Expert,** 6101 Adams Express Building. Chicago, Ill.

ILLUSTRATION.



Plain black soft wire was first introduced to take the place of wooden fences, but owing to the expansion and contraction caused by the change of weather, it would soon sag between posts, become unsightly, besides permitting the stock to crowd the wires apart and pass through or over the fence. Barb wire was then substituted to prevent this, but being made from soft wire, it would also sag between posts, and not only injured the stock, but failed to accomplish the desired result. To overcome these difficulties the light weight woven wire fabric was introduced, but owing to the fact that the manufacturers are compelled to use small soft tie wires for supports, instead of large size hard spring wire, it has been found to be a very expensive product, as the small soft tie wires, on account of their size, and further weakened by wrapping, will soon break.

FROST COILED SPRING WIRE.

The Frost Wire Fence Co., of Cleveland, Ohio, was organized for the purpose of producing and furnishing the American farmer, or user of wire fencing, with an article that would give entire satisfaction. This has been accomplished by them by the invention of machinery for the production of the genuine coiled spring wire, containing twice the strength of soft and even gauge, and fully providing for expansion and contraction. Also for the production of heavy hard spring stays for supports and metal bindings to unite wires at crossings in a cheap and practical manner. Their success has been phenomenal. It now requires thousands of tons of hard spring wire annually to supply the demand for the Frost Fence. We call our readers' attention to their advertisement and would suggest that you request them to mail you a copy of their "1903" catalogue, describing the Frost Fence, Coiled Spring Wire and Steel Gates.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.

Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

ST. LOUIS, March 30.—Butter—Quiet; creamery, 21@29½c; dairy, 18@21½c.

Eggs—Steady; 11c for fresh.

BALTIMORE MARKET.

BALTIMORE Md., March 26—Butter—Although the receipts of choice to fancy grades continue rather light, the supply is about equal to the requirements. The prevailing high prices for extras and firsts have retarded the demand to some extent. There has been quite a brisk demand for choice held creamery and several good size lots have changed hands during the week. Imitation creamery—While there is some little increase in the supply, there is little if any improvement in the quality. Choice stock finds ready sale. Ladles, when of satisfactory quality, meet prompt sale. Rolls—The unfavorable weather of the past few days has caused several lots to arrive in bad condition: all receipts in good order are sold promptly. Store-packed—There has been a better inquiry for fresh sweet stock. All invoices of choice to fancy blocks and prints meet quick sale. The market in general closes quiet, but firm on all attractive offerings.

Creamery Separator, extras, 29½@30c; firsts, 27@29c; seconds, 23@25c. June Creamery, extras, 23c@24; firsts, 21@22c; seconds, 18@20c; Imitation Creamery, extras, 21@22c; firsts, 19@20c; seconds, 16@18c, Iowa & N. W. Ladle, extras, — firsts, 18c; seconds, 14@16c. Ohio & Indiana Ladle, extras, — firsts, 17@18c; seconds, 14@16c. Roll, Ohio, extras, — firsts, 15c; seconds, 13c. Roll, W. Va., extras, — firsts, 14@15c; seconds, 13c. Ohio Store packed, extras, —; firsts, 14c; seconds, 13c. West Va. Stored packed, extras, —; firsts, 14c; seconds, 12@13c. Creamery blocks (2-lb.) extras, 30@31c; firsts, 28@29c; seconds, 25@26c; Creamery prints (½-lb), extras, 31@32c; firsts, 29@30c; seconds, 26@28c: Md. Va., & Penna. Prints, extras, 29@30c; firsts, 27@28c; seconds, 23@25c; Renovated Butter, extras, 19@20c; firsts, 17@at 18c; seconds, 15@16.

Eggs—The receipts, so far this week, while fairly liberal, have not been up to expectations; the demand has kept pace with the supply, consequently there has been a close clearance from day to day. The indications are that as soon as the country roads get in better condition, that there will be quite an increase in the receipts; the market to day closes in good shape at 14 cents. Duck Eggs are in fair receipt; the demand continues very good. After Easter there will not be such a demand, so we advise you to ship all you can immediately. Goose Eggs are in quick demand at the present time, but will not be after Easter.

Cheese—Offerings and demand moderate; market firm on all choice to fancy stock.

N. Y. State—Cheddars, fine, 14¾@15c; choice, 14@14½c; fair, 13@13½c; Flats, fine, 14½@14¾c; choice, 13½@13¾c; fair, 12½@13c; Small, fine, 14¼@14½c; choice, 13½@14c: fair, 12½@13; Ohio Flats, fine, 13½@13¾c; choice, 12¾@13c; fair, 12¼@12½c; O. Picnic, fine, 14@14½c; choice, 13¼@13½c; fair, 12½@12¾c; Skims, fine, 12@12½c; choice, 11@11½c; fair, 8@10c; Swiss Cheese, fine, 15c; choice, 12½@13½c; fair, 11@12c.

Experienced butter and cheese maker, graduate of Wis. Dairy School, wishes to change position. Have handled gasoline engines and ammonia machines. Good references. Prefer to go south, or to the Pacific coast. Address M. 66, care Hoard's Dairyman. 8 3

Farm Manager, capable and experienced in dairy farm work is desirous of securing a position. 39 years old and have had 20 years experience in the work. Have successfully managed registered herds of dairy cattle and am familiar with modern dairy machinery and methods. Well educated. Address R. E. N., care Hoard's Dairyman. 8-4

For Sale—A two horse Heebner's level tread power, on trucks, in good condition for $45. Address ALFRED MIRITZ, Kewaskum, Wis. 7-4

For Sale, a Creamery—The Star Valley Creamery Co., located 1 mile south-east of Towersville, Wis., will offer for sale on or before May 1st, 1903, the following described property: One creamery building including engine room and ice house, one 8-horse upright engine, milk and cream vats, churn, butter worker, one four beam scale, one single beam scale, and all kinds of creamery supplies Could be at a very small expense converted into a cheese factory. For particulars write W. C. WARREN, Pres., Towersville, Wis., or GEO. E. ANDERSON, Sec'y., R. F. D. 5, Viroqua, Wis. 7-3

For Sale—Creamery, Ice Cream and Commission Business in good Iowa town. Splendid refrigerator that will hold over a carload and plenty of ice packed. 20 horse-power boiler, 10 horse-power engine—everything in good shape, long lease on building. Will be sold cheap. Address H. N., care of Hoard's Dairyman, Fort Atkinson, Wis. 7-2

For Sale—The entire outfit for making American cheese; all in good order. Will be sold at a bargain. JAMES VIPOND, Shullsburg, Wis. 4-6

For Sale—Complete city dairy (no cows) and ice cream plant in thriving southern city. Output 500 gallons milk daily at profit of 9 and 10 cents. Daily expense less than $30.00. Price $7.000. Can furnish experienced dairyman and ice cream maker with $2,000 cash to invest in the business as a partner, or will sell as a whole. Best reason for sulling. Address "APRIL", care of Hoard's Dairyman, Fort Atkinson, Wis. 8-tf

For Sale—Five high grade Guernsey heifers 8 to 18 months old. Sold to make room for registered stock. HENRY TIPPERY, Callensburg, Pa.

Medium Red Clover Seed for sale, crop of 1901, in lots of 2½ bushels or more, $7.00 per bushel. sacks free. J. M. WAGNER, Hillsboro, Wis. 8-tf

For Sale—Bull calf 7 months old, also heifer calves from 2 to 10 months old all well bred A. J. C. C. Jerseys. Price low for quality. F. X. HOFFMANN, Millersville, Sandusky Co., Ohio.

For Sale—U. S. Separator No. 6, $65.00. Dairy farm of 101 acres $4,000. M. R. BUCHANAN. Columbia, Tenn. 18-2

For Sale—Three registered Holstein bulls one year old; also a few heifers. FRANK BREWSTER, Bowers, Wis. 8-2

For Sale—Gang press and 16 hoops 8x15. Pohl curd mill, self salter. Curd knives. Been in use 12 months. Will sell any or all cheap. E. B. HALL, Langdon, N. Y.

DE LAVAL CREAM SEPARATORS

ARE SO MUCH BETTER THAN

OTHER CREAM SEPARATORS

BECAUSE—They are constructed under many all-important patents, which cannot be used by any other manufacturer and which enable De Laval machines to skim cleaner and produce a more even and more thoroughly churnable cream than is otherwise possible, at much less speed and wear, and with much greater ease of operation.

BECAUSE—The De Laval makers have ever been first and foremost in the manufacture of Cream Separators throughout the world—have ever led where others follow—their factories being among the finest machine shops in the world and their knowledge of Cream Separators far greater and more thorough than that of any comparatively inexperienced would-be competitor.

BECAUSE—The one purpose of the De Laval makers has ever been the production of the very best Cream Separator possible regardless of cost, instead of the mistaken "cheapness" which is the only basis upon which any would-be competitor can even make pretence of seeking a market.

BECAUSE—The vastly greater sale of De Laval machines—ten times all others combined—enables the De Laval makers to do these things and much more in the production of the perfect Cream Separator that no one else could attempt.

A De Laval catalogue explaining in detail the facts here set forth may be had for the asking.

Apply to agents Chicago & North-Western R'y. 8-2

Which Breed?

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of March 6, under the above caption is a reply to A. R. T., signed by Fred E. Harriman that contains certain statements, which it seems to me are very misleading, and which should not be allowed to pass without explanation. I do not desire to take the space in your valuable paper, which might be more profitably devoted to some other subject. I realize fully that the discussion of the breed question by the partisans of any particular breed is likely to be barren of any good results. But so is the partisan discussion of any other subject. There are certain fundamental principles connected with the selection of a breed that should not be lost sight of, and it seems to be necessary to emphasize them over and over again before the average farmer begins to realize that they exist. It is doubtful if this question is capable of solution in the abstract. Which is the best breed? If there is any best breed we all want to know which one it is so that we may secure it. It seems to me it is much like the question, which is the best kind of pie? It depends somewhat on who made the pie, and the individual taste of the eater. And in regard to breed it depends somewhat on the purpose for which the cows are kept, and the individual taste of the keeper. What I have to say in this article has reference to breed simply as an economic butter producer.

Let me premise that a test like the Pan-American or Columbian can never determine which is the best breed. Such tests simply show that the Jerseys or the Guernseys or the Holsteins competing, according to the result, produced butter at a lower cost than their competitors. The result was affected by many conditions, such as the skill of the herdsmen in compounding rations, the physical condition and environment of the cows, their age, previous treatment, period of lactation, etc. This much, however, can be said: The price of feeding stuffs was the same for all, the environment was the same, and the herdsmen were left free to feed little or much, a wide or a narrow ration as in their judgment seemed best. But five other cows from the same breed might have made a better or a poorer showing. There is no certainty even that if the test were repeated with the same cows the next year that the result as to the breed or the individuals composing the breed would be the same. From this I trust no one will conclude that I am belittling the value of such tests. In my judgment they are of very great value, and are an important factor in determining which breed one is to select. But they are only one factor, and they do not or never can determine which breed, as such is best. Their importance is enhanced by the length of the test, and the fullness of the data concerning feeds and their cost.

There can be no argument, I take it, that net profit is of primary importance to the farmer, as it is to every other business man. In selecting a breed or the individual cows of a breed, the important question is, what will be left after the feed has been paid for? Of course this includes feed produced on the farm as well as that bought. It ought not to be necessary to make this statement, but I find that it is.

Mr. Harriman says in his article "the truth alone can survive; as to the Buffalo test, the Holsteins gave 6000 lbs. more than any other breed, and made 33 lbs. more butter than their nearest competitors, and won the test against all breeds as they have, of 90% of all other public butter tests in the U. S." As this statement is for the most part not true, according to Mr. Harriman's standard it is not entitled to survive. The Holsteins did produce 33 lbs. more butter fat, not butter, than their nearest competitor, but they were fourth in the butter fat contest, not first, for the reason that the net profit was below that of the Guernseys, the Jerseys, and the Ayrshires. The official figures are as follows: Net profit, Guernseys $230.10, Jerseys $225.44, Ayrshires $217.68, Holsteins $210.56. Of course it does not follow, as I have already stated, that one is justified in drawing the conclusion that the Holsteins rank fourth as a butter breed. Five other Holsteins might have stood third, or second, or even first.

It ought not to be necessary to point out that seven day tests are of very little value except for advertising purposes. Even when the cost of feed is considered, and in such tests no account is usually taken of the cost of feed, such tests simply show what the particular cow can do for a very brief period, under a system of forced feeding, that would destroy the value of the cow if continued very long, and has very little importance in determining the selection of cows for a working dairy where net results alone are valuable. Of two cows, each giving 6,000 lbs. of milk in a year, the one which gives a big flow of milk in the flush of feed but dries off early, is less valuable for all dairy purposes, than the one which gives a smaller amount of milk from day to day, but is a persistent milker. I have had in one of my dairies two cows standing side by side, one of which never gave over 38 lbs. of milk in a day, while the other gave 59 lbs. At the end of the lactation period the 38-lb. cow had given over 1,000 lbs. more milk than the 59-lb. cow, and both cows were of the same breed. I give these figures simply for the purpose of showing how little importance should be attached to seven day tests.

Mr. H. compares the cost per pound of producing butter as shown by certain tests of Holsteins and Jerseys made at different times and under different circumstances, in which comparison the result is shown to be very unfavorable to the Jersey. It does not seem possible that he can believe that his basis of comparison is a fair one, or that the conclusions that he draws therefrom are of any value to a person seeking information to enable him intelligently to decide as between Jerseys and Holsteins as economic producers of butter. No data are given as to the conditions under which the Holsteins produced butter at such an abnormally low cost. Whether they were running on good pasture and fed only a small grain ration, or whether they were stabled and everything they ate charged to them does not appear. He might have materially lowered the cost, low as it was, had he made it a one day test and not have fed the cow anything at all on the day of the test. It does not even appear whether the price of feeds was the same, the environment the same, or the period of lactation the same. All of the factors entering into the tests must be determined to give the comparisons any value. If he had taken the Buffalo test, extending over a period of six months, where the price of feeds was the same and the environment the same, the result would have been

Your Dairy

May be kept ever so clean, your cattle may be pedigree stock and you may feed them in the most approved manner, but your patrons will never suspect these things if you deliver milk from a ramshackle wagon. An attractive milk wagon attracts trade; it's not a luxury, but a practical necessity.

The Koenig & Luhrs wagons are built for the business. They embody every convenience, are handsome in finish and general appearance, are made of good materials and are so well put together that they'll last for years. A quarter of a century's practical experience has taught us the "know how" of good wagon building. Are you considering a new wagon? It will pay you to get our catalog and prices before placing your order.

JOHN BAUSCHER, JR., Box 35, FREEPORT, ILL.

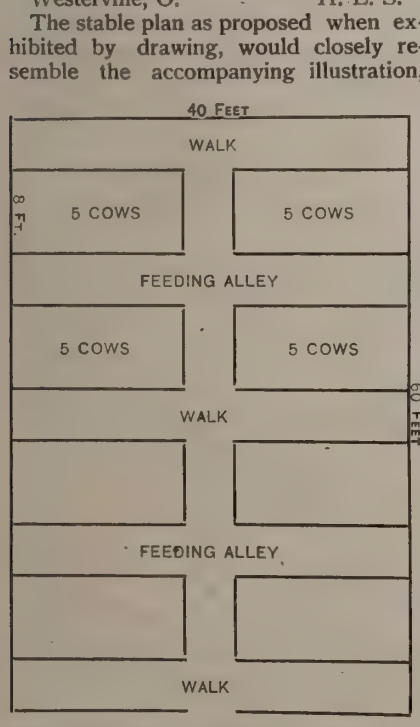
quite different. The Holsteins in that test produced butter fat at a cost of a little more than twelve cents per lb., and the Jerseys at a little more than eleven cents. I have taken the figures for butter fat rather than those for churned butter advisedly, for the reason that the basis for estimating the butter from the fat is not always the same and consequently liable to be misleading. But if the average cost per lb. of butter is preferred, the Jerseys produced for 9.48 cents per lb., and the Holsteins for 10.93 cents, making them seventh in the list.

If any valuable results are to follow the discussion of the breed question, we must get rid of the polemic spirit. When we approach this or any other problem, we must do so not with the spirit of the lawyer holding a brief for his client, but in the spirit of a judge charging a jury, with the scientific spirit whose purpose is the discovery of the truth. In conclusion let me say that I do not own any Jerseys, and consequently am not prejudiced in their favor. A. A. B.

Otto, N. Y.

A Proposed Barn and Stable Plan.

An Embryo Ohio Dairyman.



ED. HOARD'S DAIRYMAN:—I am a dairyman in embryo and am not hampered by either experience or preconceived opinions, so am ready to assimilate both hand-book and journal.

Upon a recently purchased farm, I am preparing to place a "cow barn," with mows above, to accomodate 40 cows. I have calculated upon a 40x60 foot floor space. This includes a passage way 5x60 ft., and passages crosswise from this before and behind the four rows of stalls. Have I been liberal enough in my estimate? Would an 8 ft. ceiling be about the proper height? Shall put in cement floor and ample light and ventilation.

Another question I should like to ask regarding the silo. In getting out timber for barn, would it be advisable and safe, to get out 2x6 in. oak, (which will cost me the cutting,) for silo studding, providing I use a drop siding on the outside, and double sheet the inside (circular) breaking joints—or single sheeting and plaster with cement mortar?

Westerville, O. H. L. S.

The stable plan as proposed when exhibited by drawing, would closely resemble the accompanying illustration,

and thus looked at, seems to condemn itself, The central alley is too narrow, and the neccessity for distributing feed from it, 16 ft. on either side, and also removing the droppings, involves a large amount of unnecessary labor. A stable 40x60 ft. is also too small for 40 cows and makes no provision for box stalls or calf pens. The building should be at least 80 feet long, and we would fasten the cows in two parallel rows facing outward. We consider an 8 ft. ceiling sufficient. The oak studding for silo will be satisfactory, but it does not need to be larger than 2x4 in.

The Cream Separator in Kansas.

ED. HOARD'S DAIRYMAN:—An interesting and significant meeting of hand separator dairymen and cream shippers was held in Salina, Kansas, on March 2nd and 3rd., under the auspices of the Empire Cream Separator Co., Bloomfield, N. J. About 100 representative dairymen and creamerymen were in attendance.

Monday's session was largely given up to a discussion of the hand separator question from the creameryman's point of view. Mr. Ernest E. Bell, secretary of the Empire Cream Separator Company, presided. The discussion of the advantages of the hand separator system to the creameryman, brought out the fact that by enabling him to draw upon a larger district for his cream than it is possible to draw upon for milk, he is enabled greatly to reduce the cost of production, and by making larger and more uniform shipments of butter, to command a better price in the market. The creamerymen admitted that the whole milk creamery is already a thing of the past, simply because it has been superseded by a better and more economical system. The relative merits of the various hand separators on the market, were freely discussed, the ideal conditions insisted upon being simplicity of construction, easy of operation and especially, ease of cleaning. Cleanliness is the first requisite of good dairy products, and unless a machine can be easily cleaned it will in a short time, become foul and turn out a poor quality of cream, from which it is impossible to make a good quality of butter.

Monday evening's session was occupied by newspaper men who instructed the creamerymen how they can spread the glad gospel of the better system of dairying.

Tuesday was "patron's day," and many interesting facts were brought out on the farmer's side of the question. One Iowa gentleman present said that he could not afford to go to the old system of dairying on his farm for $500 a year—not that he received quite that much more money for his cream, but taking into consideration the extra cash from his monthly checks and the extra value of his skim milk, the added value of his calves and the fewer stunted pigs he raised, he is considerably more than $500 ahead, to say nothing of the labor he has saved.

A Nebraska farmer said that under the new system his wife and boys conduct the dairy, and during 1902 their cream checks amounted to $600, which they were able to leave untouched for current expenses. Easy running and simplicity of construction were the features especially insisted upon in the separator.

In the evening the visitors were entertained at a banquet given them, by the Empire Cream Separator Co., at the National Hotel. Covers were laid for 100 guests, including a few representative citizens of Salina. Wednesday morning the meeting adjourned to attend the Kansas State Dairymen's Association meeting at Manhattan, the trip being made in special a car.

The Empire Cream Separator Co., which is conducting a series of similar meetings in the dairy states of the west, deserve great credit for the educational influence it is exerting.

M.

Quality of Skim Milk.

I use a No. 2 baby separator and the skim milk shows 2-10 of 1 per cent fat; is that as clean skimming as you would expect? My buttermilk shows 2-10 of 1 per cent. What ought it to show?

Westland, Ohio. A. W. E.

The skim milk should not contain over 0.1 per cent fat and the buttermilk not over 0.3 per cent, when good work is being done.

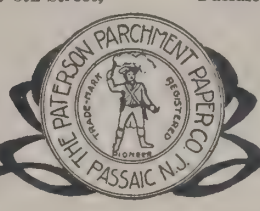
THE MARKET MAN KNOWS BUTTER

quickly absorbs odors from other articles kept in his shop. He knows also how perfectly good butter is preserved and how surely his patrons are pleased when it is wrapped in our



Pioneer Brand

Parchment Paper.

It preserves for long periods the purity of the butter, keeping in all its natural sweetness and flavor, and shutting out everything that would taint or cause it to become rancid. It is purely a vegetable paper, without smell or taste. Your name, trade mark, or dairy may be printed on every package, and it will never rub off or discolor the butter. While it protects your good butter it makes and preserves for you a good name. Send for samples and ask for copy of our booklet, "Better Butter." All sent free.

Dairy Conditions and Prospects in Northern Illinois.

Milk Prices for the Coming Year.

The Borden Condensing factories at Elgin, Carpentersville, Algonquin, McHenry, Belvidere, Dixon and St. Charles made semi-annual contracts for milk on Thursday. The price paid is an average of 5 cents higher per hundred than a year ago and is the highest paid since 1893. The average price is $1.04½ per hundred. For April and September the price is $1.20, for May and July 95c, for June 85c, and for August $1.10. The farmers here are fairly well satisfied although they claim that the price of feed and the cost of production is more than equal to the advance. Oatman Bros. of Dundee pay the same average, but the price by months differs. It is: April, August and September, $1.15; July, $1.10; May, 90c, and June, 80c.

The Elgin Butter Co. pays an average of $1.02⅚, the highest price ever paid by that company for summer milk. The price by months is as follows: April, $1.15; May, 92c; June, 85c; July 95c; Aug. $1.08, and Sept. $1.18.

W. W. Sherwin at St. Charles will pay 2c less each month than the Borden Company, an average of $1.02⅚.

A meeting of Dundee dairymen, who have formed an organization, was held and a general feeling to change the method of farming was manifested. Many stated their intention of abandoning exclusive dairying and going into general farming, paying especial attention to the raising of hogs and calves, and taking some milk to the factories.

Dundee is the center of one of the best dairying districts of Illinois and one of the prominent dairymen of that section has this to say of the proposed change of plan:

"The farmers of Dundee township have tried to maintain better prices for milk, while Elgin and Algonquin farmers have stood back and practically done nothing. We are fixed, and well fixed, for making milk in this country and our farmers have grown into the practice of handling cows and milk but the remuneration has gone so low they cannot stand it. See the price of fresh cows—new milkers—$50 to $65 and when we sell them for from $10 to $30, where is the profit?

"At a dairymen's convention it was figured that the average price for the milk of each cow in Illinois was $29, while the cost of producing this milk is $33 per head, so where is the encouragement of keeping our big dairies in the business?

"Pork is high, and is going to stay high priced as long as our laboring man, the meat eater, keeps to work, and that will be as long as the manufacturers continue to flourish, which looks like a long time yet.

"We see by the papers that the western farmers are organizing, both grain and meat producers, to hold and obtain better prices for their products, and why should not milk producers do the same? We cannot do any worse than we are now doing, even if we stop producing milk. Butter and cheese are higher than they have been for 25 years, and are going to stay high in price. Chicago is demanding all the milk produced within reach of it, and other large cities have got to have milk. These condensing factories are short of milk. They cannot fill their orders at the present time. Why should we not have a living price for our labor?

"The milk business is the most confining, most laborious and most dirty work of any other mode of farming. See the prices of horses and all kinds of machinery and still going higher. Grain we have to buy, costs more than Chicago prices and all feed we buy is higher here than in Chicago.

"We think it far better to try other modes of farming—sell a few hogs, and instead of buying horses and cows, have some to sell each year. Sell a few tons of grain and such stuff instead of buying all the year round—straw of all kinds, also shredded stalks when baled command a good high price. Let us try some other way—it will only take a short time to grow into other ways of farming.

"While we look for and expect a better price for our milk this summer we do not think it will be high enough but what mixed farming will pay better. Farm lands are renting 150 miles west of here for $7 per acre and the product which pays it is grain, and that same land is selling as high as $150 per acre with poorer buildings than ours here."

Elgin, Ill. H. C. B.

The Art and Science of Feeding.

ED. HOARD'S DAIRYMAN:—In a recent communication to the DAIRYMAN, the writer hereof sought to direct attention to the scant emphasis, in proportion to its importance, being given to the art as distinct from the science of feeding. While desiring to recognize and show full appreciation of the science as so far developed, and give credit due to all and sundry instrumental in that development, it was sought to impress the thought that inasmuch as science rightfully considered, is a part of and helpful to the art, teachers of the science and writers on how to feed, should lay greater stress, than is being given, on the necessity of acquiring that art, if best possible results are to be secured through knowledge of the science.

It is the purpose of this communication to indicate direction in which effort may be made to establish methods by which students and others can acquire rudimentary instruction, at least in fundamental principles, that will be most helpful at the beginning of the experience essential in complete equipment, in shorter time with a minimum of mistakes and discouragements, and to present some of those principles as demonstrated in my personal experience.

As a first requisite, a habit must be acquired of close, careful, discriminating observation, to a degree that enables prompt, almost intuitive, instant recognition of variations in condition from day to day. It includes intimate knowledge of temperament, moods, habits, appetite, evidence of digestion and assimilation, in short, the individuality of each and every animal included in the care. As of initiatory importance in this connection, some method must be provided by which effort and results can be readily comparable and interest stimulated. Tabulated permanent records are a prime essential, dual in form and of a character to show the amount of grain and forage consumed and the resultant product by individuals. The record of combinations and nature of rations may be more general as to distribution, but should be accurately specific in kind and nutritive ratios with space for memoranda of results and notes of impressions, suggestions, findings and conclusions. That for performance should provide for weight of each milking, a. m. and p. m., total daily yield of herd and individuals for a week or month. We prefer those for a month, our sheets having provision for such record for twenty-five cows each. With suitable scales, one for weighing feed, one conveniently placed and balanced with pail so reading shows weight of milk as taken from the cows and a graduated scoop holding four quarts, the essential preliminaries are provided. Their intelligent use will furnish replies to the following questions, upon the full understanding of which, and just appreciation of them as influencing factors, success depends, and incidentally determine whether or not a feeder can be developed from the material at hand.

Does each and every cow of similar weight and apparent capacity require equal quantity of feed for maintenance and most profitable returns?

What proportion, in pounds, of grain ration does each cow require to produce her maximum flow of milk?

Is the maximum flow sufficiently in excess of the ordinary to justify an increase in amount of grain over that required for the ordinary?

What influence in yield of milk in pounds and ounces do varying conditions and kinds of forage exercise?

For best result with each individual, what proportion of total ration should be grain, what forage, and does varying produce results at the pail or in condition?

At what time in her period of lactation does this, that or another cow utilize an undue proportion of her feed to put on excess of flesh, and how much reduction of grain ration will she stand and return the maximum flow of milk for the period and still acquire and maintain judicious condition against time of freshening?

These are some of the questions suggested in an off-hand consideration of the subject and indicate a thousand and one factors in the art of successful feeding.

In a general way Science furnishes a reply to those questions in bulk as follows—"for the average cow weighing one thousand pounds a properly balanced ration containing—pounds of dry matter, in two feeds daily is required", and adds as a clincher, an after-thought, a sort of a hedge for shelter from responsibility for possible disappointing results, "judgment should be exercised and variation made as experience may suggest." This general formula for the "average" may be most useful and the resultant value of the skill, experimentation and effort represented in it cannot be overestimated. Its highest value to the feeder however is in its suggestiveness as a whole, as a starter, a position from which to make intelligent variations, in which lies concealed very much of the dairymen's profit or loss.

In our herd of about 300 milch cows it would surprise you to know, it might expose me to the charge of Munchausenism if I were to say how many cows there are of larger weight requiring actually a smaller ration of grain and forage to produce a larger daily yield of milk than others that weigh less and give less milk, though showing a profit on their care and keep

Is there any reason, other than ignorance of method to secure it, why you, reader, if a feeder of dairy cows, should not prefer a fifteen or twenty per cent profit on individuals in your herds to five or ten per cent over cost of feed and labor? We have cows that will show even a greater difference, fed with the due regard to the principles to which I am seeking with every possible emphasis to direct your attention, than would result from a scientific, machine method of feeding pure and simple. Do you know the per cent of profit or loss which each individual in your herd is returning? Do you know whether or not a variation in quantity of ration fed each will add appreciable profit without injury to any or shortening her period of usefulness? Assuming that you know how to compound a perfect ration, or have obtained formula for one from the DAIRYMAN, are feeding the amount per head for cows "averaging 1000 lbs" and wish to know which of your cows will most surely respond profitably to a variation in feed, possibly, if you write to the Senior Editor of the DAIRYMAN, giving approximate dimensions of point and butt of her wedge shape, with outline drawing of her pelvic arch, he may tell you. If he should tell you to "use your judgment" and you realize that you have not any "judgment," perhaps if you will send exact measurements by "scale of points" to Prof. Henry and his classes in animal husbandry, they will from the dimensions of the machine be able to tell you its capacity for returns

"ADVERTISEMENT"

MORE THAN HALF.

Suffer From Coffee Drinking.

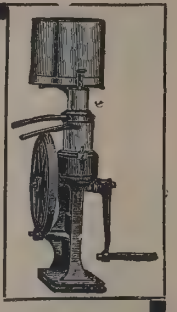
Coffee does not set up disease with all people using it, on the other hand it absolutely does create disease in thousands and thousands of cases perfectly well authenticated and traceable directly to coffee and nothing else.

This statement may hurt the feelings of some coffee drinkers but the facts are exactly what they are.

Make inquiry of some of your coffee drinking friends and you may be certain of one thing, one half of them, yes more than half, suffer from some sort of incipient or chronic disease. If you want to prove its the coffee, or would prefer to prove it is not the coffee, in these cases, take coffee away from those persons for from ten days to a month, don't change the food in any other way but give them Postum Food Coffee, and the proof of whether coffee has been the trouble or not will be placed before you in unmistakable terms.

A young lady in the St. Mary's Academy, Winnepeg, Can., says: "One of our teachers suffered a long while from indigestion. She was a coffee drinker. She became worse steadily and finally was reduced to a point where the stomach did not retain any food, then electricity was tried but without avail. She, of course, grew weak very fast and the doctor said the case was practically incurable.

"About that time I was attracted to a statement in one of the papers regarding the poisonous effect of coffee and the value of Postum Food Coffee. The statement was not extravagant but couched in terms that won my confidence and aroused me to the belief that it was true. I persuaded our teacher to leave off the morning cup of coffee altogther and use Postum Food Coffee.



"A change took place. She began to get better. She has now regained her strength and is able to eat almost every kind of food and has taken her position as teacher again." Name given by Postum Co., Battle Creek, Mich.

CHICAGO, ILL.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

in proportion to the raw material put into it; but it is more than probable you will be told to "exercise your judgment." How are you going to acquire that essential "judgment", without that close discriminating observation of individual peculiarities in temperament, appetite, assimilation, milk yield, etc., etc., I am trying to indicate and emphasize, and which finds method in knowing amount of grain and forage fed from feed to feed and comparison of resultant milk yield as shown in each milking every day, from time of freshening to going dry for next calf? Herein is where science falls short in disclosing exact method, and its exponents derelict in properly emphasizing this all important and absolutely essential element in most profitable application of the Science of Feeding to the business of dairying.

Pardon a digression, a speaking to a question of "personal privilege." Some of my readers may be disposed to ask, "are you taking your own medicine?" "Do you know which of your cows will respond profitably to a variation of feed ration?" I reply, yes and no. "Yes," in that we are applying the principle, and results secured are the suggestion and foundation for this and my former communication; "No," in that I do not know every cow with whom a variation may or may not be profitably made. Wauwinet Farm has a herd of milking cows in three interchangeable sections; one at the home farm, consisting of 143 head; one five miles off, of sixty odd; and one sixty miles away, with something over one hundred. The effort of the Superintendent is in this direction with each feeder and in every case results secured have justified the effort and stimulated increased zeal. The more specific cases indicated in this letter are actual and the direct result of the feeder's effort in response to specific instructions.

An extreme has had some advocates that best results are secured through knowledge of and catering to preferences of individual cows for one or another variety of mixtures of food stuffs, the claim being that other things being equal a cow will eat more of that which her taste prefers and return therefore a proportionately larger yield of milk. While on its face this theory seems plausible and of some value, I conceive it to be far-fetched and impractical, for the reasons that palatable preference and adequate consumption for capacity of production can be cultivated for any really suitable food stuffs. The range bred steer or cow knows nothing of corn, but can be educated to eat it. By intimate knowledge of condition of appetite and by judicious catering to it, a milch cow can be educated to eat ravenously and with enjoyment anything really suitable for her purpose.

It is time to discard from practical consideration the influence of the palate, except so far as it induces consumption of food, upon assimilation and consequent physical well-being. As evidence the maintenance of life for considerable periods by foods introduced into the system through silver tubes or by injection, where the offices of mastication have not been used, and again the acquired depraved appetites that crave that which is harmful and results in physical undoing.

Having the science as developed and so ably and consistently expounded in the recognition of the fundamental principles I have sought to indicate, and in the evolution of best methods for their practical application, largely rests the measure of profit to be realized from its promulgation. And it is up to the DAIRYMAN to so attach the art to the science of feeding in its "Answers and Inquiries" that a just conception of its importance is recognized, and to the Professors to introduce into the pedagogics of their institutions whatever of method is best calculated to impress their students with a just appreciation of the wide field for cultivation which is open to them in the art of feeding, of which science is the handmaiden and servant.

GEO. T. VAN NORMAN.

West Newton, Mass.

A Silo For Twelve Cows.

I want to increase my herd from six to twelve cows. I have only seven acres of tillable land and sixteen of blue grass. By building a silo of 60 tons capacity will this seven acres yield sufficient silage to fill silo. If so please give approximate cost and dimensions. T. P. N.

Shelbyville, Ky.

Seven acres of corn should yield not less than seventy tons of silage. A silo 12 ft. diameter and 24 feet deep would hold 48 tons of silage, enough to feed 12 cows for fully 250 days.

COMMON SENSE
Calf Feeder

awarded **Gold Medal** at Pan-American Exposition. **The only Feeder** adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

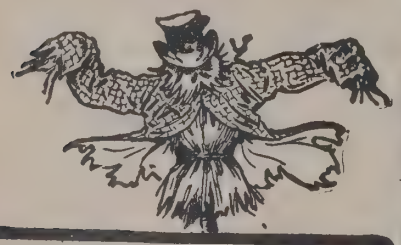
Moldy Ensilage.

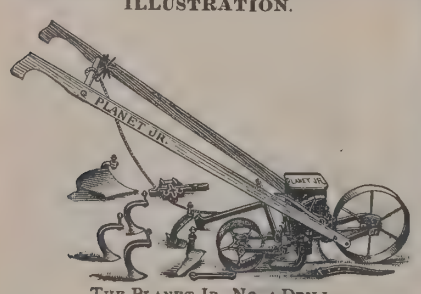
ED. HOARD'S DAIRYMAN:—On page 103, inquiry from Shippensburg, Pa., you ask for explanation of moldy silage.



Silage spoils from two causes, first from air outside coming from imperfect silo; second, from too much air left in silage at time of filling, causing combustion. This silo has not been properly tramped or rammed; or corn too ripe and not sufficiently wet at time of filling. Nearly all the failures in making perfect silage come from not realizing the necessity of density, and the even distribution of corn as cut.

I have seen several instances of mold from leveling with a 4-prong fork, throwing bunches of blades and husks in spots. I advise not filling more than 5 or 6 feet in height a day, and thoroughly ramming all over silo. I never give any special instructions as to ramming around the edges, but try to make it as dense as possible throughout, thus securing cold silage, as heat in vegetable matter is the first stages of decay, and will not be found in perfect silage. A. B. H.

Lenape, Pa.



CONCERNING OUR ADVERTISERS.

We are very glad to call to the special attention of our readers the ad of Rippley Hardware Co., of Grafton, Ill., which appears elsewhere in this paper. Their new 1903 compressed air sprayer is unquestionably the latest and most improved machine on the market. The machine has a great many uses. In fact, it is a real necessity on the modern farm. Not only is it the best machine for treating fruit trees, etc., with various solutions and insecticide, but there is nothing better to use for spraying poultry houses, hog pens and other out buildings with insecticide or whitewash. Everyone knows the value, we might say the necessity of a liberal use of whitewash about the farm buildings. The difficulty heretofore, has been the labor of applying it, but with this compressed air sprayer, the work is done more quickly, and a great deal more thoroughly than was ever possible by the more laborious hand work. One very important feature is the air compressor, by which a minutes pumping will create sufficient pressure to discharge the entire solution in a fine mist-like spray or a continuous stream, as desired. To those who have used other sprayers of equal capacity in which constant pumping is necessary in order to discharge the contents, this one feature alone will commend the machine, if there was not another point wherein it differed, but besides this it is fitted with a safety valve, which makes it absolutely impossible to pump up to bursting pressure. Moreover, the sprayers are all tested to a

ILLUSTRATION.

THE PLANET JR. NO. 4 DRILL.

The little hand implement shown herewith, Planet Jr. Combined Drill, etc., has such a wide nse that it must be a familiar sight to most of our readers. With due respect to other tools of this character it must be confessed that this Planet Jr. No. 4 is the most serviceable all around tool that can be taken into the garden. The thing that distinguishes it especially is its comprehensiveness. By means of its attachments the purchase of a single tool gives you the service of four, seeder, hoe, cultivator and plow, every one most excellently suited to its own particular work. Though for years it has been cousidered the par excellence tool, it has received valuable improvements for 1903. For every purpose short of the large operations where a Planet Jr. horse tool might profitably be substituted this is unquestionably the tool to buy. Converting it from one tool to another is the work but of a minute. Its perfect work, its special adaptation to the thing which needs to be done, and its easy running, put a premium on good cultivation. Description catalogue and free information by the manufacturers, S. L. Allen & Co., Philadelphia.

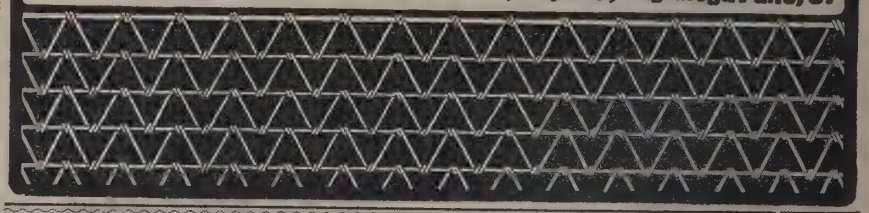
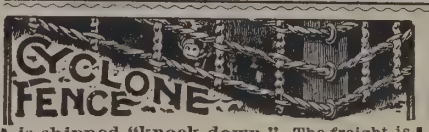
Climax Ensilage and Fodder Cutters.

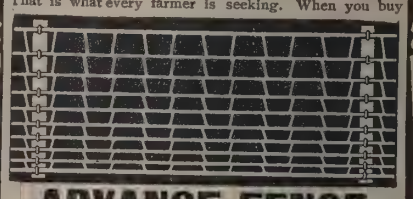




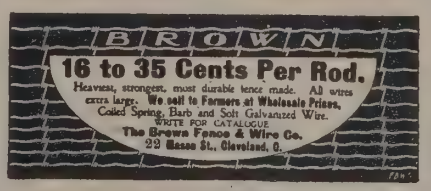
"THE COMPLETE MACHINE." Wind delivery. No more trouble with carriers. The "Climax" can be set up, ready for work, at a 35 foot silo, in 20 minutes. Takes less power to operate than any other made. The "Climax" is guaranteed to elevate **any** fodder in **any** conditions—we make no exceptions. Eight years of success bear out our statements. Don't put off getting your machine until the season is on. Write us for information and get our catalogue—it's free.

The Warsaw-Wilkinson Co.,
Warsaw, N. Y.

STUDY THIS FENCE.



Note how splendidly it is made. See the extra heavy top wire and the large, strong middle wires. Note how completely it is inter-woven. There is no chance for stay wires to slip or shift, making large and irregular meshes. There are no loose ends to untwist, unravel and injure stock. In its weaving, there is ample provision for contraction and expansion, so that it is never known to break or sag as a result of extreme heat or cold. In any height from 18 to 54 inches. Strong and handsome, proof against all kinds of stock. Write for catalogue.
CUYAHOGA WIRE & FENCE CO., Dept. D, Cuyahoga Falls, O.



is shipped "knock down." The freight is less and when it's up all laterals are pulling alike and all uprights perpendicular. We sell plain and barbed wire, staples, etc.

pressure of 60 pounds before being shipped out, which alone insures absolute safety. We trust a large number of those who see this notice and ad will write them for catalog and circulars; address, "Rippley Hardware Co., Grafton, Ill." and kindly mention this paper when writing.

BUYING A WINDMILL.

One doesn't buy a windmill every day. In fact, if one buys the right kind of windmill on the start one doesn't need to buy a second windmill for the same service in a lifetime. The Samson windmill, the perfected wind machine of the Stover Manufacturing Co., Freeport, Ill., is, as its name indicates, the strongest and most powerful and longest lived of all windmills. Perfect mechanical construction accomplishes all this, the double gearing, an exclusive feature in the Samson, maktwo trains to transmit the power of the wheel to the pump, and doing away with the hard work and wearing out of the old style windmills. The Stover Mfg. Co. solicit an opportunity to send each of our readers their beautiful and valuable catalogue about the Samson windmill. A postal card with your name and address will get it.

STOCKMEN'S SUPPLIES.

We recommend our readers to procure without delay the new illustrated catalogue of F. S. Burch & Co. Their popular remedies are as widely known as they are appreciated.

A new feature of this house this year is their list of premiums to their customers, even so small an order as $5.00 carrying some free gift while on larger orders shearing machines, dipping tanks, and other useful and desirable articles may be obtained absolutely free or at greatly reduced prices according to the value of the order. This spirit of dividing profits with patrons is at once generous and wise. It will be much appreciated by present customers of this house, and we predict will bring them a large additional patronage.

When a man will deliberately, and without solicitation, write a letter like the one published below, in endorsement of a preparation, it is pretty good evidence of its worth and value. "Bickmore's Gall Cure, which you recommend so highly, has done the business. My horse had a chronic sore back of one year's standing. I had offered ten dollars repeatedly to anyone who would furnish a cure and let me drive him. I drove 25 days in May, and applied the cure before putting on the pad as directed, and the sore got better every day. You can not say too much for it. It is worth $10 a box to anyone who has a horse as mine was. Yours respectfully, R. S. BORRADAILE, Sodus Centre, N. Y." We have carried the advertisement of the Bickmore's Gall Cure in our columes from time to time for years, and in all that time we do not remember to have ever heard a single complaint against it or its manufacturers. See the advertisement and the guarantee on another page of this issue of our paper. Write them for sample and printed matter.

"THIRTY YEARS SELLING DIRECT."

This is the headline with which our friends the Elkhart Carriage and Harness Manufacturing Co., of Elkhart, Ind., announce their readiness for this season's campaign. To have been continuously in business for so long a time and all that time to have been selling direct to the consumer is in itself noteworthy and speaks louder than anything else of the high quality of their goods and their honorable and liberal methods in dealing with their customers. The Elkhart people make every vehicle and harness they sell and sell only to the consumer. Their catalogue is illustrated with large photographic views of the latest styles and will be sent free to any reader of this paper. Write today and address as above.

OLD FRIEMDS.

It's like meeting an old friend to pick up a piece of silverware of any kind anywhere, and find it stamped with the old reliable guarantee of excellence, "1847 Rogers Bros." It has taken more than fifty years of hard work and conscientious effort on the part of the manufacturers to make those words the indisputable guarantee which we all know them to be. The original and only "1847 Rogers Bros." silverware, "the silver plate that wears" is manufactured by the Meriden Brittania Company of Meriden, Conn. it affords us more than usual pleasure, because of the world renowned merit of the articles which they manufacture, to carry their advertisement in these columns. Readers will find the advertisement on another page of this issue, and we recommend its careful perusal. Considering the hundreds and hundreds of different designs, etc., it is not possible for the advertiser to name any specific article. The wise thing to do, therefore, is to write for their new book which contains all that is latest and best in knives, forks, spoons, etc. When you have decided upon the particular pattern and article that you wish, you can go to any reputable dealer and buy it with the absolute certainty of securing the best, for it will bear the well known stamp "1847 Rogers Bros.," and no better guarantee can be given by anybody. Our readers should be careful to look for the brand and insist upon finding it on every piece, for therein lays your security in buying an article of which most of us necessarily know so little. We throw out this precaution for the reason that most best things have spurious imitators, and in this case your safeguard is the old and original brand.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

An Undersized Bull.

I have a young bull, 10 months old, that is rather small for his age; was fed on hand separator milk and would not eat oats when young. He ought to be a third larger if he had done well; he is smart and eats oats this winter. Will his heifer calves make as good cows for milk as if he was big for his age? C. W.
Baraboo, Wis.

ANSWER.

The progeny of this bull are liable to do as well as any other, provided his blood lines are in that direction.

Caked Udder.

I have a cow that I fear will loose one quarter of her bag. In the first place the end of the teat scabbed over so that it was with difficulty that I could get any milk from that teat and in two days more the quarter caked hard and is very hot and inflamed. I also have a cow with sore teats and udder. The first I noticed wrong was her teats were rough and appeared to be chapped, and in a few days the teats were scabby and it soon worked up onto the bag and that was the same as teats only more so. It seems to be inclined to spread.

I would like to know when is the best time to feed grain, just before watering or just after, or would you prefer to feed it at some other time? I have never heard that matter discussed in the agricultural papers and by lecturers, but have often thought I would like some on the subject, also when is the best time to feed grain to a horse and the best time to give it water? A. O. K.
Bradford, Vt.

ANSWER.

The bathing and hand rubbing is very important. Milk her as often as possible and apply warm lard, rubbing it in well with the flat of your hands, or you may apply lanolin instead of lard.

We believe the start of the trouble is due to cow pox.

It seems to make no material difference in ruminating animals whether you water before feeding, or after, as the water in these animals does not enter the rumen in which the food is stored and afterwards returned to the mouth for mastication, but passes right into the second so that the water does not come in direct contact with the food which has been just swallowed. But in the horse it is different. The horse has only one stomach through which the water must pass as well as the food and if a horse is watered after eating it is liable to wash some of the food in the stomach (which is not yet prepared to leave that organ), into the bowels where it will act as an irritant to these organs and cause some of the most stubborn cases of colic. Therefore a horse should always be watered before feeding.

Hog Lice.

Please give me a remedy for hog lice, both on the hog and in the bed or house. W. S. B.

ANSWER.

Make a solution of one pint of creolin to four gallons of water and drench the hogs to the skin with this solution by using a spray pump or sprinkling can. As a rule but one application is necessary.

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

TRADE MARK
SPAVIN CURE

POSITIVELY AND PERMANENTLY CURES bone and bog spavin, ringbone (except low ringbone), curb, thoroughpin, splint, capped hock, shoe boil, weak and sprained tendons and all lameness.

——FOOL TALK——

About 35 years ago a young mechanic called on old Commodore Vanderbilt, then head of the New York Central Railroad, in an effort to secure a trial on a New York Central train of a new device for stopping trains by compressed air.

"Air!" the Commodore is said to have exclaimed. "Air! Stop a train with air! I've not time to listen to such 'fool talk,' young man," and he didn't. Neither would anyone else for many a long day

George Westinghouse, for he was the man of the "fool talk," believed in himself and the utility of his invention. He kept right on in spite of Commodore Vanderbilt and the others till he forced recognition. Would a man trust himself aboard a passenger train today if he knew that train was not fully equipped with Westinghouse's invention—the air brake? It is said that Vanderbilt's road had some difficulty in getting it when finally it was wanted.

Many a man says "fool talk" when he reads the claims made for "Save-the-Horse" spavin cure, but the dawn of enlightenment is as certain as the rising of the sun, and the man who says "fool-talk" after reading the facts so plain and convincing as given by us, reaffirmed by the letters published in these columns every week, and in our booklet, is repeating Commodore Vanderbilt's mistake. No man need be in doubt as to what "Save-the-Horse" spavin cure can, and cannot, do. If you have a case different from what are described in booklets and advertisements, send us full particulars as to the age, location, cause of the lameness or swelling, the horse's action, previous treatment, and also the veterinarian's diagnosis, if you know he is competent, and we will tell you frankly as to the possibilities of our remedy. Write for booklet and copy of guarantee and any information desired.

Heed this:—
Work horse continuously if desired.
"Save-the-Horse" cures without scar, blemish or loss of hair.
Contains no arsenic, corrosive sublimate or other form of mercury or any ingredient that can injure the horse. $5.00 PER BOTTLE.
Written guarantee with every bottle.
There is no condition or arrangement we can make more binding to protect you than our guarantee.
NEED OF SECOND BOTTLE IS ALMOST IMPROBABLE EXCEPT IN RAREST OF CASES.
$5.00 at all druggists' and dealers', or express prepaid.
TROY CHEMICAL CO., Troy, N. Y., manufacturers.
Also Veterinary Pixine, for grease heel, scratches, speed cracks, cases where ulcerations extend, with transverse cracks which open at every step and often bleed, no matter how complex, aggravated, deep seated or chronic; if treated according to directions, as given on circular with every box, positively cured.
KEEPS HOOFS HEALTHY, SOFT AND IN PERFECT FORM.
Heals collar and saddle galls, hopple chafes, abscesses and all skin diseases.
Two oz., 25c.; 8 oz., 50c.; 5 lb., $4; all druggists and dealers, or sent prepaid.

ANTITOXIN
For the Cure and Prevention of Milk Fever.
No quackish humbug but a scientific fact. Works on same principle as antitoxin injection in man for diphtheria, destroying poison in system. Out of 110 cases treated in Portland, Mich., 109 recovered last year. Easily administered with a syringe. Inexpensive. Write for particulars to
DR. W. E. A. WYMAN, V. S., Prospect, Ohio.

BLACKLEGOIDS
BEST PREVENTIVE OF BLACKLEG.

Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each **Blacklegoid** (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. **Blacklegoids** are sold by druggists; *ask for them.*
Our newly printed eight-page folder on the "Cause and Nature of Blackleg" is of interest to stockmen. Write for it; it is free.

CURE "THE" COW
NO CURE, NO PAY

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of the remedy—$2.00 per quart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address
DR. EATON J. CROSS,
152 Congress St., Troy, N. Y.

Moldy Silage.

ED. HOARD'S DAIRYMAN:—In issue of March 13, page 103, J. M. M. & S. had trouble with moldy silage. Being a student of seven years' experience with three silos I would suggest that 23 feet is a little too low for the best results in silos, and to overcome this, either cut the corn a little greener, use more water, or cut it in shorter lengths, or do some of all, is probably better. If a cutter with blower can be secured it will almost pulp the corn. This year seems a peculiar year on silage, and most silos have some mold. The stalks appear to be more porous than usual, owing possibly to the excessive rains while growing.

If J. M. M. & S. had used no water this year, they would have found it much worse. The blower would be my first effort, with a little earlier cutting and wetting quite thoroughly, especially the top, as I presume that has the most mold in it. Last put not less than 20 barrels water on it after full, packing it well.

Butler Co., Ohio. P. CLAWSON.

Alfalfa Seed.

From which crop of alfala can we raise the seed? Is it the 1st., 2nd., 3rd. or 4th. crop? I cut my alfalfa 4 times last year and the 5th crop was very good but it was too late to cure it right and pasture it. S. H.

Crystal City, Mo.

Alfalfa seed should not be taken from the first crop as the flowers like clover, have not been fertilized and will not develop a profitable amount of seed. The second crop is usually best adapted for seed production.

"Haecker's Standard."

In the number of the DAIRYMAN for Feb. 12th, 1903, there is an article on "Feeding a cow 12 months," and in it there is made mention of Haecker's standard being used. Would like to know if that is a book or printed formula for feeding cows. If so, would like to purchase one.

Littleton, Col. M. R. H.

See the article, "Principles of Animal Nutrition," on page 102.

Two Lives of a Wagon

for one if the wheels would hold out. If yours are about spent don't fritter money away in repairs. Make a new wagon out of the old gears with

Electric Metal Wheels.

That settles the repairs, and you have the modern **Low Down Handy Wagon.** Wheels that are all strength, good for 4,000 lbs. burden. Straight or staggered oval steel spokes and broad tires. There's no drying out, no rutting, no breakdowns. Light draft and light labor. Made to fit any axle.

Write for illustrated Electric Wheel Catalogue. **Mailed Free.**

ELECTRIC WHEEL CO., Box 130, Quincy, Illinois.

A Handsome Book

About Mandolins, Banjos and Guitars, Free.

Any one interested in the subject of mandolins banjos and guitars can obtain a beautiful book about them free by writing to Lyon & Healy, Chicago. It contains portraits of over 100 leading artists, together with frank expressions of their opinion of the new model Washburn Instruments. Descriptions and prices of all grades of Washburns are given, together with "Facts about the Mandolin" and "How to Play the Mandolin."

LYON & HEALY,
100 Adams St., Chicago, Ill.

Washburns are sold by leading music dealers everywhere.

OUT THEY GO

The crowds are going to **Morton County, North Dakota**; rich black soil, clay subsoil, producing heavy crops—where **corn grows.** Excellent water, 10 to 30 feet deep. **Coal is Free.** Stock feeding only about six weeks in the year. **Our Creamery** butter brings Elgin prices. We own 175,000 acres and sell farm lands for $7 to $12 per acre; grazing lands $4 to $7. **Free Homestead** lands adjoining. 9,000 people now in County. Healthiest climate. Write for facts and maps.

Wm. H. Brown & Co.

$28 FREE

FOR A TESTIMONIAL

You can have ripe tomatoes June 15th, ripe melons July 1st, new potatoes and cucumbers May 15th. All other vegetables or flowers as early by using Gold Mine Hot bed. It protects all kinds of plants from frost, cold raw winds and storms. Keeps off the bugs, insects, cutworms. Stimulates plant life in such a manner as to make them grow three times as fast. Indorsed and recommended by every agricultural paper in the United States, and by every farmer that has used them. There is not a Tool or implement that the farmer buys that will bring him in as large returns each year as this. It will pay for itself forty times a year, with proper usage.

We have reduced the price from $1.50 per dozen to 85 cents, for immediate acceptance. Sold on the same guarantee to give satisfaction as plows, binders, and mowers are sold, or money refunded. When you find they are better than you expected them kindly send us a testimonial. Next year you will want more of them; we will reciprocate your kindness with a present.

We will give 200 Gold Mine Hot Beds to the person sending in the best report; 100 for second best; 50 for third; value $28, and pay all charges to destination. Premiums paid in November. Points considered—Earliness yield, amount of money made, with one dozen. Please do not delay your orders.

Reference by permission: Commercial Bank, Greentown.

EGGS FOR HATCHING

I can serve you better than ever with eggs fo hatching. White, Barred and Buff Rocks, Cornish Indian Games, Dark Brahmas and many other varieties. Also Ducks and Geese. All prize winners. Write for prices. J. P. Gonigam, Ottawa, Ill.

200,000 ACRES TO SELECT FROM

We own 40,000 acres in Red River Valley, in Marshall and Kittson Co's, Minn. and in Walsh and Grand Forks in N. D. 15,000 acres in LaMoure, N.D. Fine stock ranches in Logan and Mercer Co's, N.D. 50,000 acres of Timber land in Aitkin Co. Minn., and Washburn Co., Wis. Also 15,000 acres in Southern Minn. in Lyon and Redwood Co's, near Marshall.

WRITE FOR OUR MAPS. We can give you a farm from $5.00 to $50.00.

BURCHARD-HULBURT INVESTMENT CO.
705-7 Manhattan Bldg. ST. PAUL, MINN.

Mr. S. E. McNair of Livingston County, New York, asks for a report from dairymen who have had some practical experience in soiling cows through the entire summer. He has read Peer's work on Soiling, but is not quite satisfied. Short, crisp reports on this subject would be very timely just now, especially from those who have been successful to a greater or less degree. It is no particular objection to "soiling" cows that three out of five, who have tried it, have not been satisfied, provided the other two have been successful, the presumption in such cases being that the failures were due, not to the system, but to the inefficient manner in which it was practiced.

Alfalfa in Canada.

Ed. Hoard's Dairyman:—Do you think I could raise alfalfa in this Canadian climate. I have some ground on the east side of a hill, where the snow always lies deep so that it almost never freezes and the soil seems very strong, as some of it has been bearing timothy for nearly ten years and still cuts a fine crop. If you think this would be suitable for alfalfa, would you please tell me how to prepare the ground, when to sow, how much seed will be required per acre, where it can be obtained, and at what cost? Would you tell me also if it will raise a crop the first year or would I need to sow some kind of grain with it? E. B.

East Bolton, Que.

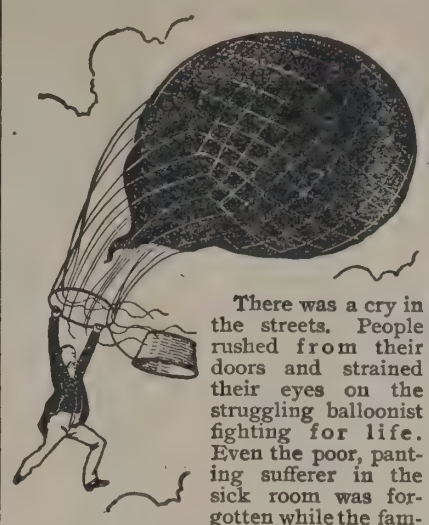
The Ontario Agricultural College distributed alfalfa seed for several years to farmers throughout Ontario and found that in some localities it was quite successful and in others it was a failure. The failure seemed to come from poor seed, winter killing and improper soil. This shows that alfalfa can be grown in Canada under proper conditions. We do not know enough regarding your local conditions to say positively that you can grow it, but would advise a trial on a small scale this year. The seed will cost 10 or 12 cents per pound and you will find directions for sowing and the preparation of the ground in recent numbers of the Dairyman.

Dairy Returns in Oregon.

Ed. Hoard's Dairyman:—Having seen very little from Oregon, I thought I would let you hear from an amateur dairyman. I started two years ago with 4 cows. I first got me an Empire cream separator, 400 lbs. capacity. Then I subscribed for Hoard's Dairyman, then I got Henry on Feeds and Feeding, and Woll on Soiling and Silo. Then I got me a pair of scales and weigh every pound of milk each cow gives at each milking, and set it down on tablets to the credit of each cow, and weigh every bit of feed she eats and charge same to her, so I know just what each cow is doing all the time. We sell our cream, what we don't churn for our own use.

Two years ago, I built me a round silo, 12 ×27 feet and filled it with clover, and it was first-class silage too. Last year I filled it with clover and fed through the summer, and in fall refilled with corn, but liked the clover the best. The cows ate the clover better than they did corn and gave more milk and the cream tested higher. Now I will tell you what my cows are doing. Last year I milked 6 cows, and family and hired hands made 8 grown persons all the time, and haying, silo filling and harvesting a 200-acre farm, took lots of butter. We sold $363.09 worth of butter and cream anyway. This year we are milking 7. In the month of February we sold (one of my cows is 2 years old and one 15 mos.)

7 cows.



2 qts. whole milk each day, 5 cents	$2.80
1 pt. cream	2.30
Cream check from creamery 233 days	45.15
Cream churned 4½ days	7.26
3640 lbs. skim milk	5.48
Total	$62.99

FEED PER COW.

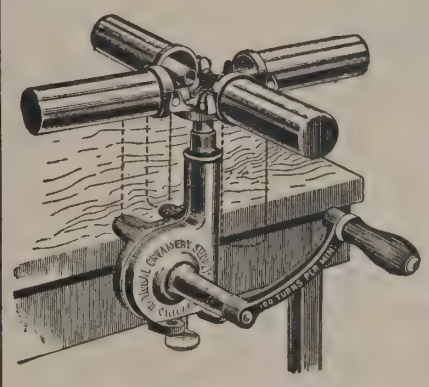
7 pounds ground oats and barley	$.07
1 pound oil meal	.015
35 pounds clover silage	.02
10 pounds hay	.03
Cull potatoes	:015
Total fed	$0.15
15x7 equals total one day	1.05
28 days equals	29.40
Clear profit	$33.59

J. M. W. Bonney.

Woodburn, Oregon.

There was a cry in the streets. People rushed from their doors and strained their eyes on the struggling balloonist fighting for life. Even the poor, panting sufferer in the sick room was forgotten while the family gazed breathless at this strange tragedy of the air. Then they went back to the sick room to tell of the terrible struggle for life they had just witnessed. It did not occur to them that under their very eyes a more terrible, more pathetic struggle was going on daily.

There can be nothing more pitiful than the struggle the consumptive makes against disease. The greatest help in this struggle is gained by the use of Dr. Pierce's Golden Medical Discovery. It cures obstinate coughs, weak and bleeding lungs, emaciation, and other ailments which if neglected or unskillfully treated find a fatal termination in consumption.



"In 1898 one of my daughters was suffering on account of a severe cough, hectic fever, wasting of flesh and other symptoms of diseased lungs," writes Rev. Joseph H. Fesperman, of Barium Springs, Iredell Co., N. C. "I promptly gave her Dr. R. V. Pierce's Golden Medical Discovery with gratifying success, and she now enjoys excellent health. This being true, I hereby heartily endorse your medicines."

Accept no substitute for "Golden Medical Discovery." There is nothing "just as good" for diseases of the stomach, blood and lungs.

Dr. Pierce's Pleasant Pellets assist the action of the "Discovery."

NATIONAL

Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitab than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each	$4 00
No. 2,—4 bottle, complete for testing milk.... each	5 00
No. 3,—2 bottle, complete for testing cream and milk, each	4 50
No. 4,—4 bottle, complete for testing cream and milk, each	5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

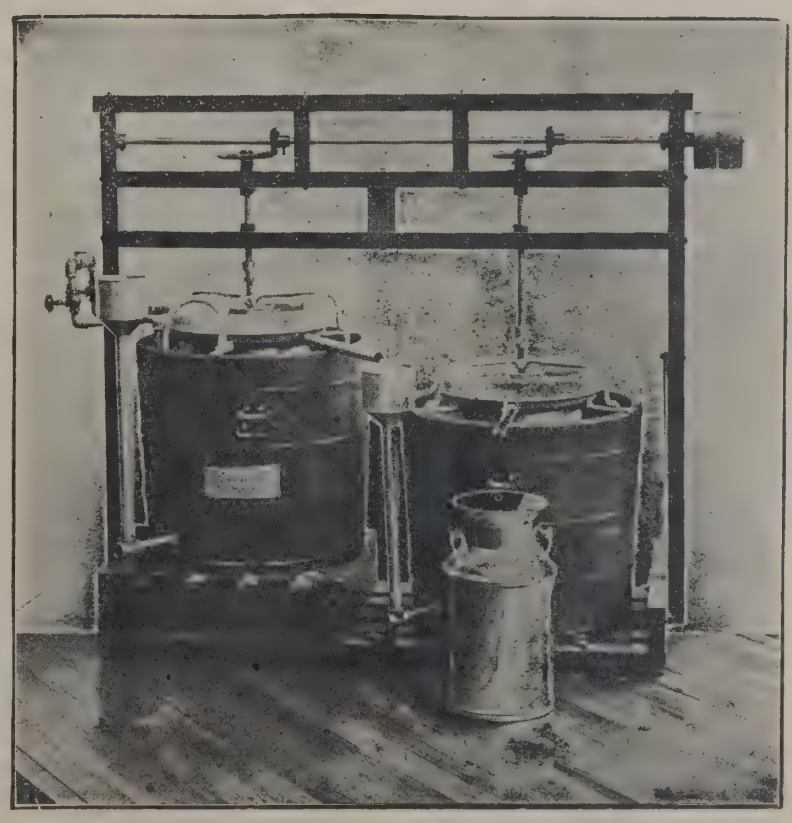
PLANO

TIES EVERY SHEAF

Why bother with a "cheap" or worn-out Binder when a PLANO will save temper, time and team?



The Plano Binder holds the highest record ever made for accurate tying; its famous Knotter (composed of only 16 pieces—about half the usual number) has actually tied 391,000 bundles without missing one, and ties harvest after harvest without a miss.

Built to work well under trying circumstances, the Plano Binder handles ordinary crops with greatest ease. The stored power of its patent Fly Wheel prevents miring or choking down—makes the draft uniform and light.

If you want a Binder, Header, Reaper, Mower, Rake, Sickle Grinder, or Husker and Shredder, call on the Plano agent. Catalogue free.

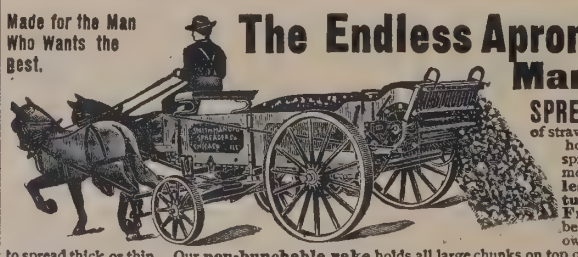
The Samson

The Only Double-Gear Mill, Frictionless, Noiseless, Perfect as a Watch, and Works In Any Wind

Every man who is about to install a new windmill, or replace an old one, should familiarize himself with the workings of the **Samson Double-Gear Windmill.** Its actual work all over the world demonstrates that it does four times the work of all old style machines, and lasts twice as long. It works perfectly in the heaviest wind, or under the gentle pressure of the summer zephyr. Try to ride a bicycle up-hill, using only one pedal to propel it. You are doing the work of the old single-geared mill. It's a strain on you, and on the machine. It's slow work. Now try the same hill, using both pedals, and you will understand the principle of the **Samson Double-Gear Mill,** and why it is the most **reliable** and **economical** mill made.

WHAT THE DOUBLE-GEAR IS

This feature alone places the **Samson** in a class by itself. It consists of two (2) gearings engaging each other, making two (2) trains to transmit power to the pump. The entire mechanism is ingeniously simple, giving the least resistance or friction and precluding the danger of strain on any part. The gear case has four (4) bearings or points of contact, giving great rigidity and strength to the operating parts. The weight of the wheel is borne squarely by a long bearing within its own hub. Every part is specially contrived to withstand sudden and violent storms, to distribute weight, and minimize wear. The tower, sails and vane are constructed of rust-proof galvanized steel.



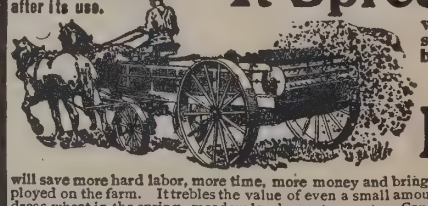
We Guarantee the Samson Windmill

To be made of good material, and to be stronger, more perfectly self regulating than any other. Its name indicates its strength. Read this over again, then send for our **free booklet.** We have a book that tells about windmills—shows pictures of them in every country, and tells all that is worth knowing about them. It will interest you, and show you the differences. You will know the right kind from the wrong kind. **It is free.** Just write for it, and don't buy until you see it.

An Interesting and Instructive Book about Windmills—FREE.

THE STOVER MANUFACTURING CO., Box P, Freeport, Ill.

Made for the Man Who Wants the Best.



The Endless Apron Great Western Manure Spreader.

SPREADS and **pulverizes** all kinds of manure, fresh, well rotted, mixed, full of straw or cornstalks, sheep manure. No matter how tough, we guarantee our spreader to spread it so evenly that one load will do more good than three spread by hand. **Endless Apron** is always ready to load. **No turning back** after each load is spread. **Front wheels** cut under and machine can be turned in its own length. **REGULATED** motion to spread thick or thin. Our **non-bunchable rake** holds all large chunks on top of beater until they **are thoroughly pulverized. Combined Hood and End Gate** keeps manure away from beater while loading and acts as wind hood in spreading. **LIGHTEST DRAFT** ever produced on a manure spreader, because front and rear wheels track and the load is nearly equally balanced on front and rear axles which brings load up close to horses. **Send for free illustrated catalogue** giving full description and how to apply manure to secure best results. **Saves time, labor, money.**

SMITH MANURE SPREADER CO., 59 N. JEFFERSON ST., CHICAGO, ILL.

It pays for itself on the first crop grown after its use.

It Spreads Manure,

wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED

Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

BUTLER MFG. CO., Kensett, Iowa.

A SIGNIFICANT COMMENT.

Mr. C. M. Sanders, of Penfield, Ga., in writing a business letter to the DAIRYMAN says:

"I have been trying to induce some of my neighbors to take the DAIRYMAN, but I find that the most of them who are successful dairymen are already subscribers to it and the others do not seem to need any help."

Dairy Statistics in the United States.

ED. HOARD'S DAIRYMAN:—I gather from the last United States census reports (1900), the following of interest to dairymen.

The number of farms in Illinois..... 264,151
The number of farms in Illinois reporting dairy cattle..... 230,625
The number of cows reported in Illinois. 1,007,664
The value of their products.....$29,638.619
or about twenty nine dollars per cow.

The Illinois cows average only 454 gallons of milk, or 3,850 lbs. for each cow per year.

I find the ideal cow gives 2,754 lbs. of milk in thirty days.

I find Kansas cows average less than twenty dollars per cow, also Nebraska and South Dakota.

	Cows.	*Product.*	*Ave. per cow.*
Iowa.....	1,423,648	27,516,870	$19.30
Minnesota.....	753,632	16,623,460	23.00
Vermont.....	270,194	9,321,389	36.00
New York.....	1,501,608	55,474,155	37.00
New Hampshire...	115,036	5,591,272	55.00

I find in our own state the three principal counties are:

	Farms.	*Cows.*	*Value product.*	*Ave. per cow*
Mc Henry.....	2,598	52,593	$2,243,974	$48.00
Cook.....	4,491	35,030	1,585,252	44.00
Kane.....	2,163	42,744	2,177,289	50.00

It is generally accepted that it costs thirty dollars and over to feed an ordinary cow one year.

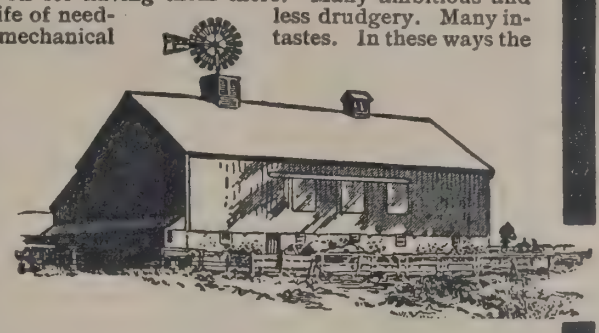
In Mr. Gurler's work of testing and keeping records for one year of over three hundred cows, he finds the extremes to be:—One cow charged $2.07 to make 100 pounds of milk, or 52 cents for one pound of butter fat. The best cow, 29 cents for 100 pounds of milk, or 6 6-10 cents per pound of butter fat and the H. B. Gurler herd averaged a net profit of twenty six dollars per head over and above the cost of feed.

Dairymen! Study these figures, then weed out the poor, unprofitable cows, and take better care of and feed a more balanced ration to those that pay a profit. JOSEPH NEWMAN, President Illinois Dairymen's Association.

Elgin, Ill.

Alfalfa in Washington.

ED. HOARD'S DAIRYMAN:—I notice in issue 27 ult., page 56, inquiry by F. W. T., North Jackson, Ohio, about alfalfa. This is our main crop here, and we have it on every foot of land where it will grow. We find that a sandy loam, with gravel subsoil, is the typical land for this plant. One thing it does not like, and that is wet feet. It will not live where water stands within two or three feet from surface. As the plant sends down a very strong tap-root (I have seen them 9 or 10 feet long) it soon gets a good hold and must be a great feeder.



From what I have seen in this state and California, I would not hesitate to try it on any land with good, natural drainage, even pretty heavy clay.

We have some trouble here with its winter killing when we have very cold weather and no snow on the ground to protect it. With us it will stand any drouth, even 8 months, after it gets one year old; it will not do it first year.

Mission, Wash. S. C. H.

KEEP THE BOYS ON THE FARM

Don't let drudgery drive the boys away from the farm. You need them. They need you. They will be better off on the farm. The country will be better off for having them there. Many ambitious and capable boys leave the farm for the city to escape a life of needless drudgery. Many ingenious boys go to the city workshops to satisfy their mechanical tastes. In these ways the country every year loses to the cities thousands of its brightest and most capable boys.

But you can't blame the boys. The boy never yet lived who enjoyed turning the grindstone for two straight hours. There is no particular fun in turning a corn sheller for that length of time. The fodder cutter comes in the same class. It is a mighty disagreeable job to chase a pair of horses around an old sweep power every time you want to grind a little feed for the stock. But when it comes to pushing a buck saw through ten cords of hard wood — well, who can blame the boys for getting sick and tired of farm life? The boy is foolish who grinds his life out with useless drudgery.

AN AERMOTOR DOES THE WORK, THE BOYS HAVE THE FUN

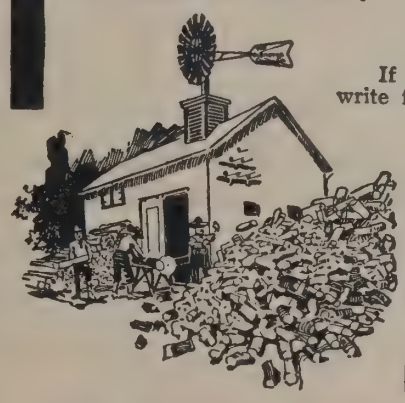
Modern devices and improved machinery will take away from farm life nine-tenths of all its drudgery. A power Aermotor erected on the barn will grind the grain, shell the corn, cut the fodder, saw the wood, turn the grindstone and pump the water. It will do more than this. It will give the boys a chance to develop their mechanical ability. There is something wonderfully fascinating in the whir-r-r and buzz of machinery. Where is there a good healthy boy who doesn't enjoy shoving a hickory stick up in front of a circular saw? The sound is music to his ears. A power Aermotor, an Aermotor Steel Frame Saw and three boys will saw ten cords of wood in a day. The boys will enjoy it, too, from start to finish. The next day the Aermotor will be ready to shell 300 bushels of corn. It will grind 100 bushels at the same time, and not require 15 minutes attention for that part of the work.

AN AERMOTOR GRINDER TAKES CARE OF ITSELF

The Aermotor Grinder is a marvel of simplicity and efficiency. It is built with a centrifugal feed, which regulates itself perfectly to the velocity of the wind. It will take the grain as fast as the mill will grind it, and no faster. Build a good, big hopper above the grinder to supply the grain as needed, and it can be left to take care of itself for hours at a time. That is different from a team of horses and a sweep power, isn't it?

PUT THE AERMOTOR ON THE BARN

With a power Aermotor on the barn, and all the machinery under cover, stormy days can be spent most profitably. There is always plenty of wind on a stormy day. Work done then is all clear gain.



Fit up a nice little shop with machinery to be run by an Aermotor; make half the tools you now buy. Mend the broken wagons, plows, etc. Be independent and save money. Do work for the neighbors and make money. Many power Aermotors have paid for themselves the first year. Give the boys work that they like to do and keep them contented on the farm.

THE POWER AERMOTOR HAS NO EQUAL

But remember that the Aermotor is the only successful power windmill ever built. It has been imitated, but the vital features which make it so much more powerful than all others have been overlooked. It has no equal as a power producing windmill.

Every farmer who raises grain, and every stockman who feeds grain, should have a power Aermotor on his barn. Large sums of money are spent for farm machinery which is used only a few days each year. A power Aermotor, which costs less, will be found useful 365 days each year.

Many people get along year after year without a power Aermotor, but after they have had one a few weeks they always wonder how they ever lived without it. They would as soon think of giving up the reaper, mower, or horse-rake as the power Aermotor. No farmer can boast that his place is equipped with all modern farm machinery if it lacks a power Aermotor.

LET US SEND YOU OUR BOOK

If you would like to know more about the power Aermotor, write for our book. Remember that the Aermotor is the result of 5000 experiments to learn how to get the utmost power from the wind. You can't afford to buy any power mill except the Aermotor. You would pay more and get less if you bought any other. This book tells you why. It is free for the asking.

What Thousands of My Clients Say

When I tell you that thousands of clients have endorsed my methods of handling real estate (no matter where located) it ought to prove that I can surely be of service to you if you want to buy or sell any kind of a farm, home or business in any part of the country. At least it should convince you that you cannot afford to buy or sell without investigating my proposition. When I say that I can give you better service than any other broker, I am only repeating what thousands of others have said. I don't ask you to take my word. I am willing to be judged by my works. Here are extracts from a few recent letters from well pleased clients.

"I received your check today covering the full amount realized on my building lots at Boulder, Colo. I am pleased with the way you have handled this matter, and can endorse your methods of completing quick sales." Very respectfully, H. McC. Hart, Halifax, Box 227, Nova Scotia.

"In reply to your favor of recent date I take pleasure in saying that the farm purchased through you is in every way satisfactory and well worth the price I paid for it. The first price you asked me was the right price." Very truly yours, CALVIN HARRINGTON, Cambridge, Md.

"I am in receipt of your letter acknowledging draft covering commission on the sale of my office building at Amsterdam, N. Y., for $10,000 cash. I wish to thank you for the interest you have taken in the matter and express my satisfaction in having entrusted you with the business." Very truly, W. G. BARNES, Seattle, Wash.

"We have received the check in full payment for our New Jersey property. It is a remarkable fact that this property has been on the market and in the hands of various agents for more than twenty years and your success in making a cash sale in a short time is proof to us that you are the only agent who ever made a real effort to dispose of it." Very truly yours, MR. & MRS. O. C. WHITTEMORE, Athol, Mass.

"You did for me what I failed to do myself. You found me a buyer in a remarkably short time. In my opinion there is no other man in your line of work who can equal you." Very truly yours, J. O. DICKINSON, Colorado Springs, Colo.

"Your San Francisco manager, Mr. Guy C. Calden has just closed a sale of my store and real estate at Ben Lomond, Santa Crus, Calif. Owing to the business-like fashion and rapid manner in which you handled this sale for me, I am prompted, as a matter of appreciation, to say that your method for finding cash buyers is unquestionably without a peer." Very truly, BENJ. LLOYD, San Francisco, Cal.

"I beg to acknowledge receipt of the papers in settlement of the Florida property placed in your hands last February. I wish to thank you for the prompt and efficient manner in which the sale was made, and couple my endorsement to the many you already have from those who have been benefitted by your work." Very respectfully, R. H. PEACOCK, P. M., Winterhaven, Fla.

If you want to get cash for your property, no matter where it is or what it is worth, fill out, cut out, and mail the left hand coupon and find out what I can do for you.

If you want to buy any kind of a property, in any state or territory, fill out, cut out, and mail the right hand coupon and I will find just the property you want.

DO IT NOW.

OAKES & BURGER, Cattaraugus, N. Y.

THIS **PERFECTION** MILK COOLER AND AERATOR
is a simple device for cooling and aerating milk. It quickly and effectually takes out all animal heat, and with it all animal odors, odors arising from stables, feed, etc. This method of treatment makes the milk keep sweet much longer. It is better for making butter, cheese, etc., and will stand shipment much better.
Cost But Little and Last Indefinitely.
They are made in sizes from 1 to 200 cows and will quickly pay for themselves in the increased reputation they give your product. They come very nearly taking the place of ice in warm weather. Send for illustrated circulars and prices

A Visit to Washington.

ED. HOARD'S DAIRYMAN:—Washington is the business home of the Government of the United States! This city is, and of right ought to be, the model city of the world, the House and the Home of the Model Government of the world; a Government with its ebbs and flows, and ups and downs of tidal life, but ultimating in a flood of fortune to fortunate people of this Northern and Western area and its annexes.

George Washington has the right to the Fatherhood name of this town, and its history is worthy of repetition until it is known as a household word. Topographical engineering has here done its perfect work, and here perhaps more than in any other town on earth is demonstrated the grand fact, that physical environments have to do with mental and moral and spiritual status, and Washington, as a Town, is formed up for hightest human habitation. George Washington, himself an engineer, was the Father of this Town; L'Enfant, the French engineer, was his chief executive, and they together surfaced this town at its start, and for a century since, with all the aids of highest and best engineering skill heroically applied, there has been evolved this surfacing and building of an area for a town proper, and its results are here visible in the faces and forms and manners of its inhabitants.

Washington is an object lesson in topographical religion; its streets are designed, its grading roofs the town, and these streets are a preface to those golden streets of Paradise; and cleanliness, every where apparent, which is next to Godliness, betokens it. The heavens here let loose their water from the clouds, not to be sullied and soured in detaining bog or mud hole, to breed disease and death, but to do its cleansing work and to go joyfully on its way to the Potomac, to the ocean, and to its return again to the clouds, in its eternal rounds of beneficent washings of the face of the earth, notably in Washington, over this correct surface grading and through a sewer system that is the science of exit. Here it may do its doings, quickly and well, and merit that old commendation, "well done thou good and faithful servant; enter thou into the joy of thy Lord." Happy clouds that hover over Washington! Happy water, that falling here, is not impeded in its work!

Washington, its ornate buildings, the delightful presence of its citizenship, its great function as the Governmental Township of a great nation, may be treated by other hands, but let me lay the garland of merited tribute at the feet of its surface grading and its scientific sewers, which are foundational in their service, but that sustain and uplift this higher human life, existent here at this focal center of all that American citizenship holds most dear; the running of the scientific governmental machinery for a free people, without vibration and without friction or break.

Thank God that the physical area upon which this seat of government rests is correct.

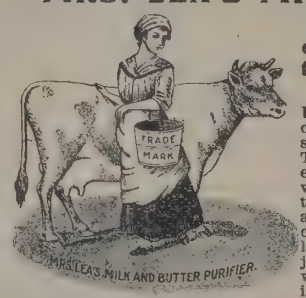
which have been fed

PRUSSIAN STOCK FOOD,

mixed with the other rations, will be in prime condition for best results when changed to grass. It will condition the system and prevent scours and other troubles arising from the sudden change. **Prussian Stock Food** is the **best condition powder** and **Blood Purifier** on the market. Horses, Cattle, Hogs and sheep grow rapidly and remain healthy from its use.

How It Pays the Dairyman.

"I am using **Prussian Stock Food** with great success. Following is a true statement of the flow of milk from my 16 milch cows. For the month of January, 1902, I received 11,090 lbs. of milk and the test was 4.40. I cannot speak too highly of **Prussian Stock Food.** The flow of milk from the same 16 cows for the month of February, 1902, (28 days only) was 10,330 lbs.; amount of check, $106.39. I wish to state that four of my cows are only 2-year old heifers. Two cows came fresh last June, six in September and eight in November and December, 1901.
JOHN McCORMICK, Waterloo, Wis."



Calves Average Gain of 80 lbs. per month.

"There is nothing equaling your Stock Food, especially for calves. Our calves, ranging from 5 to 10 months old, have made an average gain of 80 lbs. per month. So I cannot say too much for your Food.
E. SOUERS, Warren, Ind."

Ask your dealer for **Prussian Stock Food.** Don't take a substitute. Send us the names of six farmers and we will send you our **"Stockman's Guide"** free.

PRUSSIAN REMEDY COMPANY, St. Paul, Minn.

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

Dr. Jacob Michaux, Richmond, Va., and **Dr. W. L. Robinson,** Danville Va., Ex-Presidents of the Virginia Medical Society, write as follows: Gentlemen—Having been consulted by you with regard to your "LEA'S MILK AND BUTTER PURIFIER" we beg leave to state after many careful experiments that we are most favorably impressed with its value. From the standpoint of physicians we have no hesitation in saying that the milk from cows to which it is fed is acceptable to the delicate palates and stomachs of the sick in cases where ordinary milk is not borne. We, having a knowledge of the formula, further state that it is not in any way injurious to either the stomachs or systems of the animals to which it is fed, nor to the stomachs or systems of persons using the milk from such animals. We further believe from our knowledge of your preparation that it so favorably influences the digestion of the animal that it will prevent those abnormal fermentations which produce injurious chemical reactions in the secretions and milk of said animals. We advise that Sanitary Dairies be encouraged to use this product, as it furnishes a milk not only devoid of all vegetable and animal odors and flavors so objectionable and so frequently found in milk not thus treated but that it is a sweet and pure article for the table and for the use of invalids. [Signed] JACOB MICHAUX, M. D.

Schwertfeger Settles the Question of the Best Breed.

Dear Gufferner:—I got your letter all right. You want to know iff I wouldn't been so kind und seddle dat Breed Gueshtion wat has all along been making so much dishputements in de bapers. Wy, shure ting—surtinly! Dat's easy for me. I'm really surprished dat you didn't ashk my help before. But I guess I know how it iss: You tought you had it all fixed and broved up dat your kind was de bestest;—lem me see, wat you call dem again? Herefort? No, dat can't be, de Herefort is a fine beef cattle, und yours is de dairy kind; well it makes no differenz wat de name is, dey got a nice color anyway;—und now all to wonced comes dwo fellows from New York, one I tink is an Irishman und de odder must be a Cherman nobleman because his name shtarts mit "von", und dey shows dat dey got ofer dirty bounds of butter from one cow in chust sefen days; und she was a *Holshtein* mit a horriple name —I couldn't efen read it, but her middel name was Chulip. Well, I dont tink dats so anyway; und I see you has been trying to figger it down to 24.5 bounds.

Aber I dont care efen iff it iss dirty; dont you let dat worry you a tall. Day say exceptshuns prove de rule, but dat aint so mit cows. Because one cow gifs a whole lot dat's no sign dat all de rest of de same breed do de same; nossir! I found dat out long ago. Days been all kinds of dests made mit all kinds of cows und breeds, aber dat dont brove wich iss de best; it only broves dat dere are a *whole lot* of breeds wat iss all *good nuff*. But wat is de best breed for John oder Joe oder Jacob dat debends untirely ubon de kind of a man John und Joe und Jacob iss, und de kind of farms dey got, und on a whole lot of odder tings.

You dont undervershtand dat? Well, I can exshplain. We take John furst: He got a hundert and dwenty acres of good fine land wat would be chust de ting for dairying; aber he always got trubbel getting help—somehow de hired men und he dont get along fery well, und he dont like to work any doo well himself—eshpecially he dont like milkin. So he dont want to haf doo many cows to milk. He sooner raise shteers und sell beef und may be some sheep und grain und a few colts und such. Well, now, for dat man mit *such* a conshtitution, you wouldn't say dat de Chursey oder Gurnsey oder Holshtein oder Airsher und all dem butter making kinds was de best, would you? Off course not! He better puys him some Short-horns or such like. He's one off dem fellers wat dalks so much about de "chaneral burpose cow." You see he wants to get *some* milk because he's got to haf it for lots of tings, und den—well it brings him some reaty cash wat always comes hanty. Aber you can see trough de whole fellow—hiss heart runs on selling de *critters* not deir broduct; he wants to sell grain und *beef* &c., und de dairy end iss only a side show mit him.

Den dake Joe! Hiss farm is not gwite so goot as John's; but he's a worker! He would milk fifdeen or dwenty cows alone if he got to; aber he don't haf to because he's got a goot hired man und a couple of stout poys off his own growing up, who help in de summer und in de winter doo before und afder school. Mit him all dat labor has to count. So he works his farm for all wat iss. He ain't got no dwenty-year-old worn out basture; no Sirree! His basture was his hayfield for dwo years before now und will be his cornfield dwo years later. Den he raises lots of corn und hay und as much grain as he needs for feed. Now wat's de best breed of cows for him, heh? A goot *dairy* cow of course, such as de Gurnsey oder Chersey oder Holshtein, &c. Aber *wich* one, you want to know. Well dat depends a goot deal on de man's notions. Dat feller is going to make money out of any of dem, shure, und it makes nix ous wich one he chooses. But now Joe, he's a fellow wat figgers like dis: He's got dwo silos und dey dake so many acres of corn to fill mit. Den he's got to have so much land in hay, so much in grain, so much bashture, und dat leaves him so much ofer for corn for de hogs und to grind up for de cows oder de young shtock. So he finds he can keep a whole lot of hogs, ashpecially iff he gets lots of shkim milk. Und he likes to raise hogs anyway: Dem ringles in de tails und dat cholly grunt wen dey dife into de troff full of schwill, dat appeals to his heart. Of course Joe dezides for de Holshtein—und den because he's doing so well mit dem he prags und tells everybody dat de Holshtein is de best cow. He don't say a darn wort about dem tree oder four wat he first had in de lot wat gafe only fifty bounds of milk und broke de law effery day because it dested less as tree prozent! Und he don't say nodding about wat a lot of drubbel he had to imbrove his cows so as to make his aferage test come up to four und tree tents prozent—I tink now it's efen a little more. Aber wat we care, he got dere chust de same; und dat was und iss chust de right kind of cow for him, und he's making lots of money. Now wat goot would some of dem odder kinds been for him? Joe's got great bick hands und so haf all his poys. Iff deyd taken one of dem short milk boints of some cows wat I know in each hand de milk would all run down deir shleeves. Nossir, Joe bicked chust de most brofitable cow for him—eferyting reconsidered.

Und now we come to Jacob. He's got chust as goot a farm as John und blenty of help und he's a worker doo. But he dont go so much on hogs, und he likes the color und chentle look of de Gurnsey. Und he figgers that if he dont keep gwite so many hogs, he don't need so much shkim milk und not so much corn, und can keep a few more cows und make chust so much money. Und den he's got a lonely dodder,—it's a fine gurl, my Peter goes to see her gwite often—well it don't make no differenz wat de poys is all shtarted from dat kind! Nossir, I don't! Und it's none of your pusiness if I like dem, anyway. I can dakes my choice chust like John und Joe und Jacob, can't I? Aber to set your mind in rest I will say once for all, iff I was so sitchuated dat I could keep a pull, oder iff my neighbor had sense enuff not to change his'n every year or dwo, I would have no common shtuff cattle, nor efen grades. I would keep only derroughbreds mit registers und bedigrees a mile long. Dems de kind were de money is in. Oh, you git fooled on me iff you tink I ain't an eggressife farmer. I know a whole lots more dan I can dell you to onced. Aber you got me shliding off my subjeck, und to come back: I tink I hafe shpoken blain enuff now already. *Dare ain't no best dairy cow* except wen hitched up mit de man wat fits to her. "Dat will shtop gompetition for imbrovement," you say? Nossir-ee, no such ting. Chust let de man wat likes any one kind de best, according to his notions, go aheat und make his herd de most berfect of dat breed, und brove it by de results und you see wat brices he can git for dem und deir babies —und I don't care not wat breed he tries it mit—wedder it's a Chursey oder a Gurnsey oder a Airsher oder a Holshtein oder Weinshtein oder Beershtein—de result will be de same. Und dat's wat lots are doing now already. Dey don't bodder deir heads about de abshtract gwestion of wat is de best breed, because dey know dere ain't none wat is best for eferypody, und dey don't dry to make de whole country beliefe dere is only one kind in de world fit for a dairy cow; dey devilupp de one dey like best und by her results confince odders likewise sitchuated dat deirs is de best for dem.

Now I know I haf cleared dat matter all up in your mind und you feel easy apout it again. "Didn't like to trouble me?" Oh, dat's nodding. I could write a whole baper full for you. Jhust call on me for help any dime you get muddled.

Yours druly,
August Friederich Wilhelm Schwertfeger.

Rearing Calves in Australia.—Milking Machines Not Yet a Success.—Other Dairy Notes.

Ed. Hoard's Dairyman:—A very bad system has been carried on in regards to Calf Rearing, on most of the dairies in this state. But it is pleasing to note that in some instances a much more successful and modern system is in progress. In a great many instances where the calves are saved, they are mostly half starved, and when grown up are nothing better than poddies.

HOW THE CALVES ARE RAISED.

As soon as the calves are born, they are taken away to the calfery. Their first abode is in a long, narrow shed, containing about 25 small pens on both sides, with a passage in the center. Here the young animals are taught to drink milk. As soon as this part of the business is thoroughly taught, they are allowed to run in a small enclosure, where there are others somewhere about the same age. A good plan is to get them out as soon as it is possible, as they appear to do much better than if shut up. After a time the older ones are removed to another appartment, and when they reach the age of about six months, they are turned out altogether and allowed to run in the open paddocks of these enclosures for the young calves when they start to eat grass. Under this system the animals never seem to lose condition, but on the other hand, look healthy, their coats appearing quite glossy, and do not seem to be stunted in any way. Their food is made up of skim milk which contains a small portion of patent calf food, lacto fornia. This is given in the morning. Their evening meal consists of a portion of hay tea. Most probably the addition of these two extras helps in a great measure to keep them in a healthy condition.

The lacto fornia is mixed with hot milk and the hay tea is also hot when added for the evening meal. The hay tea is made from meadow hay, which is stewed all day in a boiler. This appears anything but a natural way of raising calves, but nevertheless they appear to thrive splendidly. Sometimes, when the animals are very hungry, they take too much; hence it is advisable to have some person attending to them who regulates their meals. In good herds it is well worth one's while to go in for a good system of calf rearing, as each animal is well worth saving. The heifers will come in later as dairy cows, and the bulls are well worth keeping for sires.

MACHINE MILKING IN AUSTRALIA PROVES A FAILURE.

The progress of mechanical milking has been watched, during the last twelve months especially, with the keenest of interest in this country, and nearly every person thought (like myself) that perfection had been attained at last. This fact was clearly perceivable owing to the number of new machines that were installed, and the enthusiasm that was displayed on each occasion. But I am sorry to have to state that they have not come up to full expectations and dairymen will still have to wait some time yet till the present difficulty is overcome. This is most regretable, for success seemed certain and the great problem of labor in connection with dairying was apparently solved in a very satisfactory manner.

A great number of dairymen have had their sheds fitted up with machines during the last year or two and for a time everything seemed to go along perfectly, but now a number of machines are standing idle, and hand milking has been resumed. On one farm they were in use for two years or more, and everything appeared to be going along in a satisfactory manner, until lately. As I have previously stated, for a time the machines worked splendidly, and the animals seemed not to object to them in any way, but developments have taken place which I think will lead to the abandonment of this mechanical milker for a time however, until the defects have been overcome.

The apparant trouble seems to arise from the fact of the cows, when in the full flush of the season, not giving down their milk properly to the machine, and

singular to say, this applies to cows that have been machine milked before being turned out prior to the last calving. The main fault seems to lie in the action of the teat cups, to which the animals so gradually acquire a dislike, and after giving down, from half to three-quarters of their milk, they instantly cut off the supply. It is stated that if the cow is at once stripped by hand, very little milk is obtained, but if left alone for five to ten minutes after the teat cups are removed, a hand-milker can obtain all the rest of her milk.

The inconvenience and expense of following such practice with a large herd would be an absolute bar to the adoption of the machines. However, it is very probable that all difficulties will be overcome ere long. Great improvements have been effected since milking machines were first tried, and if the only defect lies in the formation of the teat cups, this difficulty will soon be overcome.

The idea in connection with the cup is to render its action as nearly like that of a calf sucking as possible. In the Lawrence-Kennedy machine—the one which until quite recently was considered to be an absolutely successful mechanical milker—the rubber lining of the cup contracts and expands and there is a slight jerking motion, closely resembling that of a calf sucking; but this action does not altogether produce the action of the tongue of the calf on the teats. The cups of another machine, known as the Hartnett, is said to succeed better in this respect. The latest improvements in the L-K. machine is the alteration in the character of the teat cup. The leading feature of this machine is a double pipe, one applying pressure to the teat, and the other drawing the milk in an uninterrupted flow. The teat cup is fitted with an inside lining of pliable rubber, so arranged that the air pressure to the teat is exerted downwards from the udder to the point of the teat, producing a gentle drawing motion. The second pipe draws the milk away into the cans by vacuum pressure.

In the original machine—one pipe being used—the vacuum exerted pressure on the teat, and at the same time drew the milk into the cans; when a large flow had to be dealt with, the passage to the milk pail sometimes got blocked. The new machine remedies this defect, and it is said to work much faster than the old machine. It would be a thousand pities to accept defeat after so much has been accomplished. Not only is the milking machine desirable, but it is a necessity, in a community like this, where the labor difficulty is more or less acute, and where the employees of a dairy farm are practically masters of the situation Dairying cannot be carried on unless the cows are milked regularly twice a day, and the work performed with a skill and rapidity that can only be acquired after considerable practice. Good milkers are not easy to obtain, and there is no doubt the difficulty in that direction has handicapped the dairying, the development of the dairying industry. Farmers will not take the risk of largely increasing their herds, when a strike of even a day's duration on the part of the milkmen might ruin half the cows. So few hands are required to work enough milking machines to cope with a large herd, that the risk of a strike is proportionately lessened, and even if there was no actual saving in cost the certainty of being always able to get the work done is such an advantage to farmers that they would have no fears in regard to enlarging their operations. For this reason alone it is to be hoped that the defect which has been discovered in connection with the latest milking machine will be easily rectified, and that success achieved which all producers desire.

AUSTRALIAN DAIRY PRODUCE.

Prices ruled higher, but supplies diminished in the recent Australian butter season in England. A record was established for prices, as the London market quotations for the best averaged 109s 6d per cwt., or 1s 1d better than the previous season, which was 108s 5d. The season experienced in the country was so exceptionally bad, owing to the drought principally, that the quantity of Australian butter exported was not much more than half the exports of the previous season. The total quantity of butter received by England from this country during the season 1901-'02, was about 7,669 tons as against 15,293 tons the previous season. New Zealand supplies amounted to 7,307 tons, which is only 362 tons less than those from Australia. It is a very evident fact that the drought in Australia and the increasing requirements for South Africa have greatly lessened the exports to the home country; as is clearly shown by the following figures:

The supplies of Australian butter during the past three seasons have been 17,208 tons, 15,293 tons, and 7,669 tons, respectively. New Zealand exports were 7,465 tons, 7,252 tons, and 7,307 tons. The Australian consignment was made up of 116,351 cwt. from Victoria, 32,365 cwt. from New South Wales, 2,937 cwt. from Queensland, and 1,725 cwt. from South Australia. For the last five seasons there has been an improvement in the prices of Australian butter, the average price for choicest having been 100s 4d, 104s, 104s 6d, 108s 5d, and 109s 6d per cwt., respectively. Danish butter, over the same five years has averaged on the English market, 110s 7d, 113s 6d, 116s 5d, 118s 3d, and 118s 3d, respectively. The deterioration in the quality of the Australian butter is greatly deplored, and the main cause, apart from drought, is attributed to the increasing use of the home separator. In a hot climate like ours the result of farmers separating their own cream and delivering it to the factory at irregular intervals is sure to effect the making of perfect butter.

It cannot be expected that a vat containing cream of three or four different ages all blended together will produce as good butter as a vat of cream, all of one age. The individuals, who have forced private separators on Australian farmers, have done a great injury to Australian butter and have reduced the product on the British market. The deterioration is not noticeable in the New Zealand butter; this is owing probably to the excellent system of grading adopted by New Zealand, and the lower temperature at which the butter is carried in transit to the home country. Then, again, in New Zealand the bulk of the milk is daily delivered direct into the factory, each day's cream thus being kept under the control of the factory manager. As to the prospects of the present butter season everything points to a further decrease. From present indications the coming winter is going to be severe and to make matters worse, the opening of the season has been very late. South Africa will probably require a good deal this season and the high prices ruling for cattle in this country has a tendency to reduce the milking herds, as producing animals for beef has paid better than butter making the last couple of seasons; hence the probability is that our exports of butter will be considerably less. In New Zealand I dare say there will be an increase, although the high prices ruling for cheese this season will probably induce many to go more extensively for this article. On the whole, the prospects of the approaching wet season are very gloomy indeed. Most of the best dairying country is in a frightful state, there being but little fodder to carry the cows through the summer and if the autumn rains are late in coming, thus preventing a good growth before the cold weather sets in, there is every likelyhood of the losses being very severe, as very few farmers have made any preparations in regards to growing fodder crops, making ensilage or laying up a store of meadow hay.

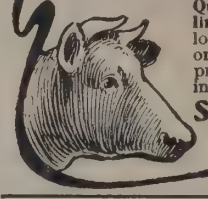
BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

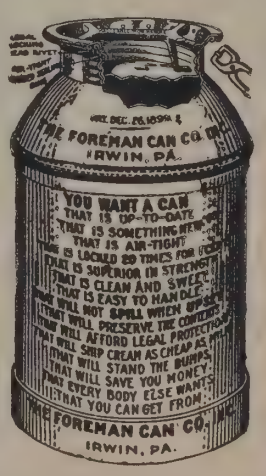
This is equally true of the Buhl Factory, "Improved Elgin" and Genuine Iowa Cans; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.



The BOYD CREAM RIPENER

STURGES & BURN MFG CO. TRADE MARK CHICAGO



Wherever it has been introduced unqualified endorsements come, both from amateurs and experienced butter makers, upon **"THE BOYD."** It places cream ripening perfectly within the control of all, and reduces it to mathematical precision. Finer and more uniform flavors are the sure results. It possesses double the insulating properties and double the cooling surface of any other machine. Its cream distributor, affording rapid cooling and thorough aeration, all unite in making it the

Standard Cream Ripener of America.

We publish a special catalogue, our No. 12, devoted entirely to a description of this matchless machine. We mail it free upon request. We also manufacture the **Dairy Queen Churn, Standard Milk Cans, Cheese Apparatus and a general line of Creamery Machinery and Milk Dealers' Supplies.** Special catalogues for different lines. We are connected in no way with any trust or combination, and devote ourselves to supplying at reasonable prices, every article applicable to the creamery business. Write stating your needs, and we will mail free appropriate catalogue.

STURGES & BURN MFG. CO., Kansas City, Mo. Chicago, Ills. St. Paul, Minn.

We wish to announce that we are now operating our new factory at Irwin, Pa. Capacity—1000 cans daily, which should enable us to fill all orders promptly.

Every can sold on a guarantee. Write for Circular H.

New York Farm and Dairy Notes.

Selected from the New York Institutes, March 21, 1903.

ED. HOARD'S DAIRYMAN:—John Gould, of Ohio, discussed the silo, as follows: He advised building a silo from the standpoint of economy. You can utilize the corn plant for feeding with the smallest loss, with the silo. It enables the dairyman to produce more milk in the winter when prices are higher. There is a great loss in drying corn fodder because of the succulence, to the milch cow. He told how he obtained his seed corn from Virginia, the common white variety that is grown in that locality. It contains more sugar than the varieties of field corn grown in the northern states. Build a good silo, but this you can do without great expense. Do not put iron hoops on the silo, but make wooden hoops; have girths sawed and nail these together so as to make a round hoop. A good form for the silo is the octagon, or it can be made round, pine flooring may be used on the outside; then you put on tar paper on the inside, and over this for the inside lining use some kind of half inch lumber, and this makes a tight silo. You can use clay for bottom, if you have good drainage.

H. E. Cook spoke on "Barn Building." Three things we want are warmth, sunshine and ventilation. The right temperature is from 50 to 60 degrees. In my stable the temperature does not go below 50 degrees in cold weather. The wall should be built with a space or dead air chamber between the walls, this is made by boarding and papering on both sides of the studding, instead of putting the building paper between the boards on the outside of the studding.

I do not build the stable over 9 feet high and give each cow about 500 square feet of space. I do not build any more plank floors but build them of cement as the expense of the cement floor is but little more and it will never wear out. For a foundation I compact the soil, then lay in small stones to the right level, then pour around them this cement and then put the finishing surface which is made of cement and sand and floated with a board to roughen it so the bedding will stick to it. Cut short pieces of iron pipe and anchor then in the cement for the studding for the partitions. The cement floor should be kept well bedded. I would plank the horse stalls.

Address by C. W. Cavanaugh on the "Chemistry of the Soil." He spoke of the selection of fertilizers for different soils. He said the commercial fertilizers contain nothing that is not in the soil or stable only in different form. Chemical analysis does not tell the needs of the soil as well as experiments in growing plants in it. The amount of humus in the soil indicates the amount of nitrogen in it. This humus is exhausted by cultivation and we must supply humus to the soil by stable manure or plowing under green crops.

These should be the main source of nitrogen on the farm. Humus also increases the water holding capacity of the soil. The cheapest form in which to buy phosphoric acid is South Carolina rock, if the soil needs phosphoric acid. If the stalk or woody part of the plant makes small growth it indicates the lack of phosphoric acid. If the soil contains potash that is unavailable, this can be unlocked by the use of land plaster. Clay soils usually contain plenty of potash.

The following questions were asked and answered at this meeting.

What would you cover silage with?

Mr. Cook: I do not cover my silos, there is a little loss but not enough to pay for covering. We tread the surface as firmly as possible and there will be less loss if the ensilage is cut finely.

What is the best way to kill poverty grass?

Mr. Cook: Probably the only way is cultivation and the rotation of crops.

What is the value of whey and how can we get the most out of it?

Every 100 pounds of whey contains 6 pound of solids. The whey should be used before it gets sour to get the most out of it.

Will it pay a person who has had three years experience in a butter factory to take a short winter course in dairying at Cornell?

Prof. Cavanaugh: It is the experience of those who have taken the course, that it is the greatest value to them and they would not lose the knowledge that they obtained there for hardly any consideration. It has been the means of making some of the best butter and cheese makers. It's a good opportunity for the young man and may help him to a good position.

Would you advise using soap on milk strainers?

Mr. Cook: No use sal soda.

When is the proper time to plow for corn?

Mr. Witter: My practice is to plow in the first part of May, this for my locality, for then you get the warmth given out by decaying sod, especially with the clover sod. This fermentation aids the corn to make a better growth. I plow only from 7 to 8 inches.

What would you do for a cow that holds up her milk?

Mr. Cook: I would get rid of her if it was a habit with her. Mr. Witter expressed the opinion that it depended on the temperament of the cows and that if nervous cows were excited in any way while milking, they could not help it.

Can milk be thoroughly pasteurized without changing the flavor?

H. E. Cook: Pasteurizing will in a degree improve the flavor of the milk, especially winter milk that has not been well cared for.

How can we clarify milk for the city delivery?

Mr. Gould: The only way is to keep the stable clean and have plenty of sunshine in it. Strain the milk well and cool down to 40 degrees. Don't use a cloth strainer more than two days, burn it up.

What shall we feed with skim milk to make the best ration for pigs?

Mr. Gould: I have seen good results from feeding middlings with skim milk and I would put in a very little corn meal.

What is the relative value of shredded corn fodder and ensilage?

Mr. Gould: The shredded corn fodder is about equal to timothy hay. It lacks the succulence of the ensilage.

Will rape fed to cows affect the quality of the milk?

Mr. Cook: It will. I would not grow it to feed to cows but it is good for hogs and sheep.

What will prevent a cow from leaking milk?

Mr. Cook: I do not think it can be prevented by any operation that is safe.

W. H. JENKINS.

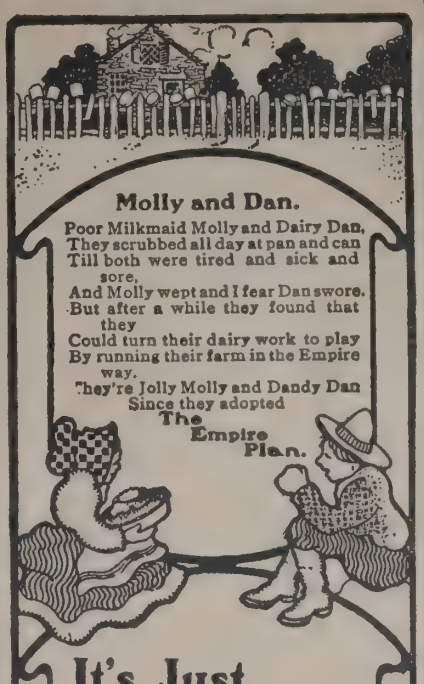
A Minnesota Ration.

Please give me balanced ration for fresh grade Jersey cows giving 20 to 30 pounds milk per day. Oats, 35c; corn, 55c; bran, $19.00; middlings, $20.00; oilmeal, $30.00; wild hay, $12.00; timothy and clover, $14.00. F. B. Mc. L.

Wrenshall, Minn.

We incline to the opinion that, at the prices quoted, this inquirer can do no better than to give his cows, as the average daily allowance, 2 lbs. bran, 3 lbs. ground corn and 1 lb. oil meal, with all the hay each will eat without waste. If the wild hay is of good quality, this may be used exclusively, and another pound of oil meal added to the grain allowance.

"ADVERTISEMENT."



SMILES

Good Cheer and Good Food Go Together.

Improper feeding is the source of most human ails. Sick people don't laugh much. It is the healthy and strong who see the sunny side of everything. Pure, scientific food will correct most ailments and bring laughter and good cheer in place of sickness and gloom.

The wife of a physician of Dayton, O., says: "Before I had finished the first package of Grape-Nuts, which I got at the urgent request of a friend of mine several months ago, I was astonished to find I was less nervous over small matters and worried less over large ones, laughed more readily and was at all times more calm and contented than I had ever been in my life. I found also that the hollow places in my neck and shoulders were filling out and that astonished me as I had always been very thin, as women with starved nerves are apt to be.

"After a time I discontinued the use of Grape-Nuts for two months and found the old symptoms return at once. I went back to the use of the food again and feel well and strong. I can increase my weight at will from five to ten pounds a month by using more or less of the food. Before I was married I was for five years a trained nurse and I have never in all my experience seen anything to act as quickly and favorably as this scientific food." Name given by Postum Co., Battle Creek, Mich.

It's Just This Way:

You can go on losing money on your milch cows if you like, or you can stop wastes, save half the labor and double your profits, by using an

Empire

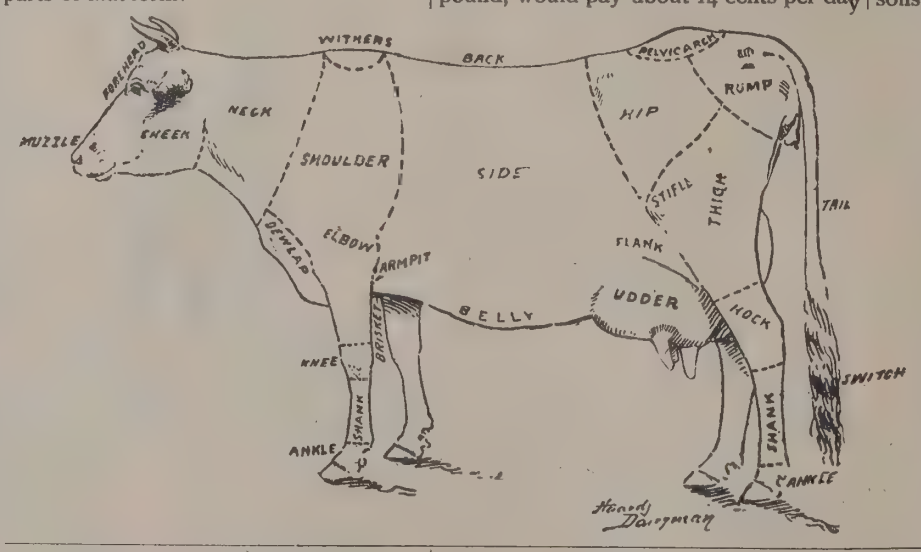
WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

PROF. Carlyle of the Wisconsin Experiment Station is reported to have said at the Marsfield Round Up Institute that he did not believe that there was a heifer calf born in Wisconsin that could not be fed to make 300 lbs. of butter a year. The Professor has unlimited faith in feed. Feed is all powerul. So great is his belief in it that we expect to hear of his saying that there is not a colt born in Wisconsin that could not be fed to trot a mile in 2-20, or a boy that cannot be fed so as to make a statesman equal to Senator Spooner. To such ends at last does the dual-purpose idea come.

ALFALFA FOR HENS.

There is one advantage of alfalfa over all other forage plants that we have never seen exploited in the agricultural press. That is its value for hens. Our large flock of Buff Plymouth Rock fowls have fed on it for two years almost constantly, so fond are they of it, that the field which lies next to the poultry house is kept constantly fed close to the earth by the fowls. We believe it is a great promoter not only of the laying habit, but as well of the growth of and size of the fowls. Persons who try alfalfa in a field near the barn, will find their hens feeding on it at all times of the day.



What is Meant By the Term "Flank."

There seems to be some confusion in the meaning of terms as applied to the conformation of dairy cattle. For instance, take the term "flank." The Guernsey scale of points in describing the desirable dairy temperament in both cows and bulls calls for "a thin, arching flank." The word flank here means that part of the body connecting the belly with the hind legs, as shown in the following diagram:

In all beef animals it is counted desirable to have this bottom line of the body to run as straight as possible. A thin arch to the flank is not counted a good beef sign. A writer in the Guernsey Herd Register for October, 1902, describing the Bull LeGrande Duke, at the Ohio State Fair, says, "A bit more arch of the rib forward, and an added *depth of flank* would serve to his advantage." It is evident that there is needed a better agreement of understanding as to the meaning of terms when applied to the conformation of dairy cattle. "An added depth of flank" would be in line with the beef conformation. Unconsciously, almost, many of our dairy people and judges carry in their minds the old Shorthorn definition of outline.

We republish herewith the cut issued some years ago by HOARD'S DAIRYMAN, giving our ideas of the dairy form and the terms used in defining the various parts of that form:

AMONG OUR EXCHANGES.

H. E. Cook contributes two, good, sound thoughts, among others, to the *National Stockman.*

He speaks of the great demand for service bulls this spring as testified to by breeders, and then asks if the nice heifer calves from these bulls will be fed and given a good, strong start as they should be. Will the owners give them a couple of quarts of new milk, say for four weeks? It will surely pay if you have a good strong calf. Some men can never see the prospective cow that is in the heifer calf. Such men never develop an animal as they might

His second thought is this: "Put a good cow into the hands of a poor dairyman and she will soon sink to his level or comprehension of cow requirement." Lots of men have tried it; it is true every time.

The Oklahoma Experiment Station has been investigating the pasturing of alfalfa and it finds that one of the chief reasons of failure is due to pasturing it with cattle or horses.

S. McKelville of Plainfield, Neb., argues in the *Twentieth Century Farmer* in favor of the same old dual-purpose cow for Nebraska dairymen and talks about the special-purpose dairy cow as being confined to limited districts and towns. By that we are to infer that Nebraska dairymen do not know enough to make the true dairy cow profitable. That is the stock argument that these dual-purpose fellows use everywhere. Seven hundred and eighty-seven farmers have been investigated by HOARD'S DAIRYMAN in its various Cow Censuses. The dual-purpose men, on the average, suffer badly in point of clean profit with the men who use special dairy breeds.

W. F. Jensen, of the Kansas Continental Creamery, says: "I never affirmed that a distinct breed of dairy cows would be the most profitable on Kansas farms." What is the matter with Kansas? Are her feeds, her climate, her farmers so terribly lacking that the same profit that a special dairy cow brings in Wisconsin or Ohio can not be had there? Some of the good dairy herds of Kansas ought to send Bro. Jensen some figures. The real dairy cow seems to be in his mind a matter of locality, and still all over the Union she is doing the most profitable work and a lot of dual-purpose men don't know it. She is not adapted to Kansas, Nebraska, Iowa, Minnesota, Illinois, etc., so they say.

We suppose poor returns at the creamery and at last 20 to 30 per cent less net profit per cow year after year, is especially adapted to the farmers of those states. Great argument that.

The science of good farming will consist very largely hereafter in a better study of farm economics. Stop waste by a better understanding of economical methods. Here is a good illustration in beef making taken from the *National Farmer* and *Stock Grower* of St. Louis:

A "baby-beef" calf which could be made to weigh 1,000 pounds in 365 days and sell on the market at 5 cents per pound, would pay about 14 cents per day for his keep from birth to market. A two-year-old beef made to weigh 1,000 pounds, say in 720 days, and which might possibly sell at 4½ cents per pound in market, would earn 6¼ cents a day from birth to market. A three-year-old steer, weighing but 1,000 pounds, would be well sold to-day at 4 cents per pound, and would earn 3¾ cents per day from birth to market. The fact of the matter is, that large numbers of range cattle reaching 1,000 pounds in three to four years old do not earn 2 cents a day from birth to market. A cattleman needs to know what his steers are earning by the day.

A false notion of true economy however would be to do as some dairymen are doing. They discard a cow that would earn them 25 cents a day for one that will not pay for her keep in milk, but will give them a calf that will earn 14 cents a day.

The following incident recorded by the *Ohio Farmer* may have its counterpart in some other herds:

"Our veterinary editor was recently called to see a herd near this city (Cleveland, Ohio) that was running down without any apparent cause. At last he requested to be shown the food that was given them. The secret was there. It was commercial feed stuff, composed largely of ground corn cob, oat hulls, etc. The cows were starving. He ordered a change of food and the cows at once began to pick up and increase the milk flow."

PUSHING CONVICTION ON THE FARMERS.

Every step of advance that has been made in dairy farming in every community of farmers, has been wrought out by overcoming the prejudice and enlightening the judgment of the men who were most concerned.

This has been the history of every creamery and cheese factory. At first there was almost an utter lack of knowledge of what to do in a co-operative sense; a lack of judgment of what they ought to expect of a creamery and especially a lack of understanding concerning what they ought to do to make the keeping of cows a success to themselves individually, and so make the creamery a success as a whole.

But few farmers have ever given themselves any study or investigation into the best methods of practice. Most men think that dairying simply consists in keeping a lot of cows just as they would keep any other cattle. So when a creamery is started in one of these general farming districts there is needed above everything else some one to push the right sort of knowledge among the people.

Well posted men know what a cow should earn; what kind of a cow to keep; what sort of care she should have; how they should care for the milk so the creamery can do good work with it, and finally what a good creamery should do for them. All this knowledge must be learned.

These remarks are prompted by reading a circular which Schlosser Bros. of Plymouth Ind. have addressed the farmers about them, giving some of the reasons why the keeping of cows is not more profitable among them than it is.

This is what they say, and it applies with great force to the farmers in hundreds of communities all over the land. They are not making the money they should make simply because they do not comprehend the keeping of cows as they should comprehend it. Schlosser Bros. say:

"The average number of cows per farm in the vicinity of Plymouth is but a little over three, and no special attention is given the few cows kept, yet we were able to buy last year, 1,465,817 pounds of milk, for which we paid $12,-621.20. Is this not conclusive proof that dairying could be made the most profitable part of our farming, if careful and intelligent attention were given it?

The expense of handling the dairy product is too great where the number of cows to the farm is so small. The larger the amount of milk the cheaper it can be handled and the more the creamery can pay for it.

Cows do not receive the proper care and feed. Comfort and a full balanced ration are absolute neccessities if good results are expected.

Too many "scrub" cows and not enough well-bred dairy cows. Also too many farmers trying to make a beef cow do dairy work.

Too much of the milk produced in the summer when the prices are low, and not enough in the winter when prices are high.

Not enough silos. The most economical and best winter feed for cattle of all kinds is silage.

Too many farmers who "think" it does not pay to milk cows. The revenue from the dairy industry in Wisconsin last year was $55,000,000. Does it pay the Wisconsin farmers to milk?"

Milk Computator—Cottage Cheese.

ED. HOARD'S DAIRYMAN:—Page 1085 you advertised "Newton's Computator." Is it the one that gives amount for pounds, price and test? That is, does it tell the price of 1,111 lbs. milk at $1.44, 4.15 per cent test, basis 4 per cent test? Show manner of working.

Can you put us onto the way to make buttermilk without making butter? And how to make cottage cheese for profit?

Massillon, Ohio. "OHIO."

The computator enables one to read off directly the amount of butter fat in pounds and the value of the butter in money. It does not give the results in the way you indicate above.

The skim milk should be thoroughly mixed with some good flavored buttermilk and allowed to ripen until the curd just forms. If it is now churned, a very fair buttermilk will result.

The following description of cottage cheese is from Decker's Cheesemaking:

A great many city dairies that turn a large part of their milk into the form of cream have skim milk left on their hands, and to make the business pay as well as possible, they naturally look for a means of disposing of this skim milk. Usually there is quite a demand for the sour milk curd, known as Dutch cheese, cottage cheese, or smierkase.

As this has been made probably for centuries, it would seem an easy task, and so it is, if conditions are just right, but as large dairies sometimes have difficulty in obtaining uniform results, a short chapter treating about the manufacture of this cheese from a scientific standpoint may be helpful.

As has been explained, the ca sein o milk is precipitated by rennet and dilute acids. Sweet milk can be heated to the boiling point without curdling, but as acid develops, the milk will first be coagulated at the higher temperatures, and then as the acidity increases, the temperature at which it will curdle, is gradually lowered until skim milk containing eight-tenths of a per cent of acid will curdle spontaneously. At about 70° F. skim milk will not increase in acidity above nine-tenths of a per cent as the growth of the lactic acid germ is inhibited. This amount of acid begins to redissolve the curd and make it mushy, so that it is hard to handle, and the acid also makes a sharper flavor than is desirable.

Fat in milk or cream takes the place of some of the milk serum. Cream containing 35 per cent fat will curdle with about five-tenths of a per cent of lactic acid, and milk containing 5 per cent fat will develop hardly more than seven-tenths p·r cent of acid. This is because the fat displaces a portion of the serum.

When other fermentations than pure lactic acid occur, trouble may ensue, for gas may make the curd froth so that it may be impossible to use it, or the flavor may be impaired. The way out of such a difficulty is to use a lactic ferment starter in the milk.

As acidity plays such an important part, it is desirable to measure the acid from time to time. For this a Farrington Acid Test outfit is required. In addition to the apparatus previously described for testing milk for an acidity of two-tenths per cent, a graduated glass cyclinder of 100 c. c. capacity is required for measuring the water carefully. One tablet is used for each 19.5 c. c. of water, or five tablets for 97 c. c. of water. The titration is then made with 17.5 c. c. of milk measured into the tea cup with a Babcock pipette. Each cubic centimeter of the alkali solution required is equal to one one-hundredth of one per cent of lactic acid.

The milk should be set in a steam heating vat, and the increase in acidity watched. Probably 80° F. will be found to be a good temperature at which to hold it. If it is desired to have the vat come off at a certain time, the ripening can be regulated by the temperature at which the milk is held.

The increasing acidity should be watched and when the point at which it will curdle is just at the temperature at which it is setting, the temperature can be raised, and by stirring, the curd will form and break, and as the temperature rises the whey will be expelled and the curd will collect in little grains and firm up. Possibly the operator may find it better to let the milk begin to curdle before turning on the steam. The curd will probably be firmed sufficiently by raising the temperature to 120° F. The stirring is kept up until the curd is firm enough and then it is allowed to settle.

As soon as the curd has settled so that it will not interfere with the whey strainer, the whey is drawn off and the curd is dipped with a curd pail into a cloth strainer. This strainer is made of linen strainer cloth, and is in the form of a tube so that it can be shipped over a wooden frame. The ends of the frame are supported by wooden horses, which are set over a drain to catch the whey. The curd is stirred in this strainer to free it from the excess of whey. Perhaps a little cream or butter may be added to the curd at this time to make it softer and more palatable. Cottage cheese, like other kinds, is more desirable if it contains a good quantity of butter fat. A little dry sage or caraway seed may also be worked into it to it to give it flavor. Salt to suit the taste, probably about two pounds to the thousand pounds of milk, is also worked in.

Local conditions may affect the form in which the cheese is put up for sale. It can be put into balls or loaves, which are cut later, or in paper packages, such as are used for oysters and ice cream. It always pays to put up any article in as clean and attractive a form as possible.

Milking Machines in England.

ED. HOARD'S DAIRYMAN:—Considering the agitation over the mechanical milker, the following extract from a letter received from Mr. F. E. Boyant, senior partner in Broadmoor Dairy, is of value, coming as it does, from a practical dairyman of wide experience.

"I have been looking into the merits of the Lawrence-Kennedy milking machine, i. e.—the machine you know, we read about in HOARD'S DAIRYMAN.

There are over 500 of these machines in use in Australia, and about 90 in England. I went down to a place called Gillingham's in Dorset to see it work; the machine had been installed at this dairy for nearly two years, so I thought it would be a good place to go, as they had cows that had been milked by the machine before calving and had since freshened and were again being milked by the machine.

I saw forty cows milked at this place in twenty-five minutes (with eight machines) by a man to put the "teat cups" on, and a boy to carry the milk to the dairy.

The machine got practically all the milk; the cows were stripped out afterward and a gallon and a half was all that was got from the forty cows.

The owner of the dairy told me he considered it saved him a lot of money and time and that since using the machine he has had no "three teaters," no sore teats or cow pox and that there is no question but what the milk is much cleaner and keeps better,

At this place they generally milk about 120 cows in summer and they had the pipes laid to all sorts of out of the way places where they milked bunches of cows.

So far I see no reason to doubt that the machine is entirely practical. It is very simple, nothing to get out of order and easily kept clean."

H. P. BLAIR,
Supt. Broadmoor Dairy.
Colorado Springs, Colo

The above report does not quite agree with what our Australian correspondent writes, unless we assume that improvements, not yet perfected in Australia, have been put into use in England.

Success and Trouble With Wood Hoop Silo.

ED. HOARD'S DAIRYMAN:—In September 1900, I built my second silo, as I had the lumber on the farm I made a wood hoop silo. Used for hoops, green elm sawed 3x½, so they are 3x3; for lumber used 1x6-in. Elm and red oak; nailed elm on inside hoop, broke joints with red oak with tarred paper between.

It stands beside a matched stave silo, and a jacket around them both, with two lengths of 16-ft. lumber with a hip roof so I have a bin on top that will hold 25 loads of corn so I never have to fill the second time. I have just finished feeding some silage that was put in in 1900, and it kept perfectly, to within 3 inches of the bottom. Never lost a bushel of silage by mold from either silo, after they were fairly opened. When asked which I like best I have to say both. When I fill silos I fill both at once and have two men in each silo so it is well packed in.

I know of two other wood hoop silos that used best hemlock fence boards for lumber, made double, same as mine except the tarred paper, and both are troubled with mold, so last summer the top half of one of them was taken off on inside, and paper put in, and this winter as far as the paper goes there is no trouble; how it will be below the paper remains to be seen. H. R. S.

Perry, N. Y.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Is It Practicable to Winter Pigs on Clover or Oat and Pea Silage?

Kindly let me know the cheapest way to winter pigs from three months old up. Can I keep them in a fairly thrifty condition on clover or oat and pea ensilage?

I want to winter them in a fairly thrifty condition ready for clover pasture in the spring.

Mt. Vernon, Wash. T. R.

It is reasonable to expect that the pigs would "live" on such silage, but they would not thrive and grow as they should. They should have in addition some corn or barley, or grain of similar composition.

For Cows to Freshen in April.

Will you please formulate a ration for me for cows to freshen in April? Ration to be of wheat bran and gluten meal and hay (timothy and white grass) and oat hay. The hay and oat hay was beaten into insensibility by a four-inch fall of hail on July 24th and most of the finer part was beaten into the ground. Have no oats, corn, stover or silage to help balance a ration, thanks again to that hail storm.

What proportion should I mix the bran and gluten meal and how much of the mixture shall I feed with this poor hay before my cows freshen, and how much after they freshen? Cows are Holstein-Friesian and Holstein-Friesian grades.

Corry, Pa. C. J. F.

It is simply impossible to offer a rule or formula for feeding cows under the conditions named. Presumably the damaged roughage contains but little available nutriment, but no one can say how much or how little. In such cases there can be no other dependence except the skill and judgment of the feeder. Prior to freshening we should not want to feed more than one pound of gluten meal daily with perhaps four pounds of bran. After freshening, increase the grain allowance gradually, slightly increasing the proportion of gluten, until the limit of profitable production is reached.

A Vermont Ration.

Am a beginner in dairying and need help along the profitable feeding line.

My cows are grade Jerseys from 700 to 900 lbs., 19 in number, giving 250 lbs. milk daily, nearly all fresh except four that freshened in September. Have not been grained until two weeks ago. Was feeding one bushel silage from immature corn and early cut timothy, and getting 220 lbs. milk. Now am feeding a mixture of 100 lbs. bran at $1.20; 75 lbs. cotton seed meal at $1.50, and 100 lbs. dried brewers grains at $1.50. We feed from 4 to 6 lbs. on silage and what hay they will eat twice daily. The grain amounts to 55 cents a day and increase of milk about 30 cents. Can you formulate me a profitable ration? Bran, $1.20; corn meal, $1.15; cotton seed meal, $1.50; linseed, $1.50; corn and oats, $1.20—barrel of oats and two barrels corn ground together.

Am weighing each cow's milk daily, and have just received a Babcock tester and will test all cows for production at a profit. Have just bought a high grade Jersey bull and heifer. Want to start right as I have just bought a farm and have got a $3,000 mortgage to pay. A. N.

Johnson, Vt.

Two weeks is not sufficient time for the increase in feed to show its full effect. The ration now fed ought to produce better results, but while the silage lasts we should prefer 4 lbs. corn and oat chop and 2 lbs. linseed oil meal to the present mixture, to be fed always in connection with the silage. Add also night and morning a large teaspoonful of salt.

Sunflowers with Corn for Silage.

Will you or some of your readers please tell me if I can mix sunflower seed with corn and plant together with planter? Can I get protein by so doing? I want to put this corn and sunflower into silo 14x30 in one operation. Cow peas do not do very well with us in corn. G. H. W.

York Road, Md.

We have only one report concerning the combination of sunflowers with corn for silage and that is published on page 1,046, in the issue for January 24, 1902. In that case, the writer and one of his neighbors, mixed the sunflower seeds with corn in the ratio of about 1 to 5, planting at the same time. The crop was harvested with a corn binder, just when the petals were falling from the sunflower heads, the seeds being fully formed, and put into the silo in quarter inch lengths,—sunflower stalks and all.

The most noticeable matters in connection with the experiment were an unusual settling of the silage, and the development of an odor resembling that of linseed oil.

Cows ate the silage with great relish, and at the time of writing no untoward results had developed. The grain mixture fed in connection was composed of 6 parts bran, 3 parts gluten, and 1½ parts of cotton seed meal, of which only about 4 lbs. per day were fed. Sunflowers add nothing to increase the percentage of protein in the silage.

Painting Inside of Silos.

Kindly let me know whether it is advisable to tar the inside of wood silos. We are told that the fermentation generates an acid from the tar which is injurious to cattle. If so, what about using ashphalt? E. J. B.

Macon, Ga.

The trend of opinion at the present time is that it is better not to apply anything to the wood on inner surface of silo.

Depth of Silage to be fed Daily.

Will you please inform me as to the depth of silage necessary to be taken off the surface every day to keep the silage from spoiling. I notice on page 127, you advise M. B. to build one 16 feet diameter, 24 feet deep. Allowing for settling, about 1½ inches in depth could be used each day if fed 180 days. Would this be enough to keep from spoiling? W. G. H.

Cherry Valley, N. Y.

Something depends upon the weather. Under ordinary conditions but little damage will accrue if fully one inch in depth is removed every day, but for full assurance we should prefer to take off more. Henry, in his work on Feeds and Feeding says the rate of removal should be not less than 1.2 inches per day.

Cob Meal.

I have seen so much said in your paper about corn and cob meal; will you please let me know what is the feeding value of cob meal for milch cows? J. Q. T.

Walker, Mo.

Cob meal has very little feeding value, but it is useful in diluting or extending the ground corn kernels. Corn meal or ground corn is too concentrated for profitable feeding by itself, but should be diluted with oats, bran, or cob meal. There is quite a line of experiments which tend to prove that corn and cob meal is quite as effective as the ground corn without the cob, and the reason for this is assumed to be that when the corn is fed alone, quite a proportion passes off undigested.

Starting a Dairy in North Carolina.

O. R. H., Pelham, N. C., is about to commence dairying with 15 to 20 cows, and is anxious for some advice as to the best breed of cows for butter purposes, also for suggestions as to machinery for such a dairy, and whether a silo 12×22 ft. will be sufficient to feed 20 cows for six months.

His first inquiry has been discussed over and over again. We would not advise any beginner to start in the dairy business by purchasing a herd of thoroughbreds of any breed. Better get together a selected herd of grades or natives, the best that can be had and place at the head a bull of the breed most agreeable to personal fancy, and do not let the matter of cost have too much influence in making choice of the animal. The best is almost always the cheapest, regardless of price.

The second request can be best answered by saying that information of this character should be sought from those who make a business of dealing in such goods. Write to the parties who advertise in the DAIRYMAN and ask them to submit a list with prices. The two indispensable articles will be a separator and a combined churn and butter worker. For a beginning, both can be worked by hand, but something in the way of power will be required sooner or later, and it seems to be the prevailing opinion at present, that a gasoline engine is the most convenient and least expensive.

A round silo 12×22 ft. will have a capacity of about 44 tons, which is less than should be provided for 20 cows. Better make the silo 14 feet in diameter.

Beet Pulp and Corn Silage.

A number of our grangers here are talking about sending for beet pulp for feeding in place of ensilage. What is your opinion of the relative value of beet pulp as compared with ensilage? Price quoted for beet pulp F. O. B. here is $2.75 per ton.

Richville, N. Y. A. F. S.

According to the feeding tables beet pulp contains about 8 per cent of digestible feeding units and Wisconsin corn silage approxinately 17 per cent. We therefore estimate beet pulp to be worth one-half as much as corn silage.

A New York Ration.

Please formulate a balanced ration for heavy milking grade Jerseys, to freshen in March, from the following feeds produced on farm, adding whatever grains are necessary to balance up the ration: Corn ensilage, well eared, daisy hay mixed with red top and timothy cut when daisies were in full bloom, oats and corn; wheat bran, $21; linseed meal, $28; gluten, $26. M. H. P.
Bayport, N. Y.

After the cows freshen and the fever incident thereto has passed away, gradually increase the feed until the following amounts are used:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.50	.38	4.07	.12
2 lb. oil meal	1.82	.59	.65	.14
3 lbs. corn	2.67	.24	2.00	.13
3 lbs. oats	2.67	.28	1.42	.13
Totals	23.58	1.88	12.34	.73

After feeding as above for sometime try the effect of increasing the allowance of corn and oats, and if the results seem to justify the expense keep on increasing until the cow is receiving 10 to 12 lbs. of grain per day.

An Ohio Ration.

Please give me a ration from the following:
Clover hay, $12.00; bran, $18.00; shorts, $17.00; gluten meal, $25.00; cotton seed meal, $25.00; oil meal, $25.00; malt sprouts, $12.00; corn and oats, $20.00.
My cows are all Durham cows, and have been fresh since the first of the year. C. H.
Shepard, O.

From the feeds named above and the prices given we should select as a general average for a herd of cows about as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
4 " malt sprouts	3.59	.74	1.48	.07
4 " corn and oats	3.56	.34	2.28	.17
Totals	24.09	2.44	10.92	.58

Blood Meal for Cows.

What is your opinion of feeding blood meal to dairy cattle, meal costing $55 per ton at packing house in Chicago and quoted 87 per cent protein.
Mt. Vernon, O. A. B.

In the absence of experience, it is not safe to hazard very positive "opinions." Of course any product carrying so much protein can be fed only in very limited amounts, and in connection with other concentrates. Notwithstanding her very capacious stomach, a cow cannot eat sufficient roughage to enable her to do her best at manufacturing milk. From a quarter to a third of the dry matter in other average rations should be in some kind or kinds of concentrates. Very likely if one was feeding barley, or oats, or bran and corn, he might use with profit a pound or less of this blood meal in the daily ration.

Mowing Weeds in Alfalfa.

In a late number you say spring seeded alfalfa will usually need to be run over with a mower several times to keep the weeds down. The mower knife should be set high, etc. Now at our institute, the speaker claimed it was almost certain death to the alfalfa to cut it high and it should always be cut with the knives low. Now who is right? W. A. S.
Perry, N. Y.

The custom in the west is to set the knife high when mowing the weeds in alfalfa and there do not seem to be any unsatisfactory results from so doing.

What Kind of Peas.

Please tell me though the DAIRYMAN what kind of peas they use for pea meal in Canada. Is it the black-eyed Marrowfat? A. J. B.
Torrington, Conn.

We do not recall at this writing the specific name of the pea most commonly used. It is generally called the "Canada Field Pea," is much smaller than the Marrowfat and has a smooth skin.

Whether and Where to Buy Cows.

C. M. C., of Missouri, writes that a railroad is being built near him, and there is likely to be a large number of men at work, all summer. He makes ice cream, butter and buttermilk and also has a retail trade in whole milk in an adjoining town. He expects an increasing demand for his products and asks for our opinion as to whether he should buy a car load of springers at Kansas City, or try to pick up good cows nearer home, which are scarce and high in price. It must be manifest that the facts stated are not sufficient to enable one so far away as we are, to form any very valuable opinions.

In buying a car load of springers in such a market as Kansas City, one must expect to get a liberal proportion of culls and kickers, and some very excellent milkers. The difference in cost may more than counter-balance the added risk—for some risk there is, even when dealing with one's neighbors. If we could buy the car lot in one bunch at 15 to 20 per cent less than it would cost to buy at home we should be disposed to run the chances.

Raw vs. Pasteurized Milk.

Which milk is best for private customers, raw milk or pasteurized, and why?
Which milk is best if first cooled and clarified by running through separator, pasteurized or raw?
Columbus, Ohio. D. J. S.

Clean, raw milk can not be improved upon, provided it is kept clean, and can be supplied to the customers in that condition. If milk has to be shipped long distances in summer and is not produced under sanitary conditions, it will improve its food value and keeping quality to pasteurize it. If the milk can be run through the separator as soon as it is produced it will add considerable to its cleanliness and keeping quality, but there is no use in doing it if the milk is allowed to stand several hours before clarifying.

Wild Onion Taint in Milk.

Do you know of anything that will destroy or tend to lessen the effect of wild onions in milk? Our pasture has a great many wild onions and our customers complain so much. N. T. J.
Knoxville, Tenn.

Mrs. Lea's Milk and Butter Purifier, which is advertised in these columns, is highly recommended for that purpose. We have had no personal experience with this remedy, but it is highly spoken of.

Cleaning Milk Cans.

I have heard it said, don't wash your milk cans with soap. Will you please inform me the best method of washing cans and keeping them clean and sweet?
I ship milk to the city of Philadelphia and our cans come back occasionally in bad condition, in warm weather sour etc. Please tell me just how to do this to keep them sweet, and what to use?
Hopwell, N. J. J. M. D.

Soap is not recommended, because where hard water is used, it forms a sticky compound with the lime and casein that clings to the sides of the can, and is difficult to remove. There is also danger of the soap being scraped off in the edges of the can, which will not help the flavor of the milk.

For sour cans, a rinsing with cold

"ADVERTISEMENT."

Dr. Shoop's Rheumatic Cure

Costs Nothing If It Fails.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever. I have done it fully 100,000 times.

I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.

Address Dr. Shoop, Box 934, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

A GREAT COMBINATION!

GOOD COWS AND A U.S. SEPARATOR FILL THE FARMER'S POCKETS WITH MONEY!

The U. S. Separator gets all the cream from the milk,
The cream makes the butter,
The skim-milk makes the calf,
All bring in the cash.

water, followed by thoroughly scalding with hot water, containing washing soda, followed by clean hot water, will be found sufficient.

Should Heifers be Milked before Calving.

Please state whether heifers should be milked prior to dropping first calf, and if so, what would be the probable benefit? L. H. M.
Florence, S. C.

We would not milk in such cases unless it seemed to be indispensable in order to prevent serious inflammation of the udder. It is advisable, in our opinion, to induce the largest distension of the heifer's udder consistent with safety.

Butter Fat in Cream.

Will 400 lbs. of 25 % cream make more butter than 500 lbs. of 20% cream. Or in other words, is there any reason why a creamery patron should make more by running his cream 20% than he would if he run it 25%? W. C. S.
Waupaca, Wis.

There is not enough difference in the amount of butter that can be churned from 400 pounds of 25 per cent cream, and 500 lbs. 20 per cent cream to make an appreciable difference in the money returns. The only difference would be the amount of fat left in the extra 100 lbs. of butter milk, which might possibly amount to 5 cents, but which would not be appreciable on the total weight of butter churned out.

Partly Skimmed Milk Not Standard.

Milk in Ohio testing 3 per cent, is considered "of standard quality" according to law. Now if you have milk testing say 4½ or 5 per cent butter fat, and you reduce it down, to say, 3½ per cent butter fat, could it be said within the law, that your milk is yet of standard quality?
Ohio.

We are not advised as to the precise terms of the Ohio law, but presume it does not differ materially from the laws in other states. If such is the case, it will be found there is a provision against removing any of the fat.

A Vermont Ration.

What will be a good ration for my 15 cows, mostly fresh in March? I have good hay and good corn silage for this year. Have to buy all my grain at following prices: corn meal, $1.25; bran, $1.15; wheat feed, $1.25; gluten, $1.45; cotton seed meal, $1.50; middlings, $1.15 per 100 lbs. S. M. S.
Cambridge, Vt.

Cows freshening in March should be carried through to grass very liberally and should be fed both hay and grain for some time after being turned to pasture. Indeed, it is quite the proper plan to give them some hay all through the summer and fall. For the present, we suggest the following as an average daily allowance.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients. Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.53	.48	3.96	.16
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. gluten feed	1.80	.46	1.01	.05
2 lbs. ground corn	1.78	.16	1.33	.08
Totals	23.55	1.99	12.04	.62

And in this connection we want to emphasize what Mr. Van Norman says on page 184 about the art of feeding as distinguished from the science of feeding. It is of little avail to follow blindly and unthinkingly any prescribed formula without regards to results. There has been too much of that both with the farmer and the scientist. Watch each cow and bring her to book by weighing her milk, and if the milk product does not respond to the feed consumed, feed less or more, until she does respond, trying the increase for 10 days or 2 weeks to give the cow a fair show.

Cement Silos.

I wish to ask if a silo can not be made of grout, cement and gravel. They are making a bridge here across the Great Miami river, of grout. I should think it would be just the thing for a silo, Or would it freeze, being on the outside and silage wet? Is it necessary to put a roof on a silo? X.
Dayton, O.

It is quite practicable to build a silo from cement and gravel as suggested. Indeed this style of construction is becoming quite popular in Canada, where the English practice, of building once for all, is more prevalent than on this side the line. Of course there will be some freezing, but this objection is not given much weight at the present time. It is not necessary to put such a roof on a silo as one would put on a barn or a house, but there should be roof enough to keep out the greater part of the snow in winter, and in practice nearly every silo is provided with a substantial roof.

What Kind of Root Crop.

Will you please tell me which variety of root crop you would advise me to raise on rich bottom land to be fed to a winter dairy, where quanity and quality are both to be considered? E. D. C.
Chester, N. Y.

Where one has a silo and can raise a good crop of corn, his best profit will lie in letting other people raise and feed roots, but where circumstances seem to make it imperative to grow roots of some kind, there is probably no variety which will return better results than manglewurtzels, called mangles for short, or sometimes stock beets.

Feeding Values of Skim Milk and Whey.

Will you please give the feeding values of sweet whey as soon as can be gotten from the cheese factory; and sweet skim milk from a hand separator on the farm, for calves and pigs.
Dorchester, Wis. A. W.

The feeding value of both skim milk and whey depends very largely upon the feeding skill of the man who uses them. Neither is fit to be fed alone, but either makes an excellent supplement to other feeds. They are very unlike, in that skim milk is a highly nitrogenous feed, whereas whey is almost purely carbonaceous. Therefore with skim milk, especially for pigs, we mix ground corn or middlings,—not less than one pound to five of milk—and with whey the demand is for oil meal, or some of the glutens. Thus fed a hundred pounds of skim milk is worth half as much as a bushel of corn and whey approximately one-third as as much as the skim milk. Specific, iron-clad rules for feeding cannot be given. If the feeder will not, or cannot, exercise some skill and judgment, based upon skillful, daily observation of results, he will be sadly disappointed with the outcome.

Size of Silo Required.

Blue Joint or Red Top for Hay.

ED. HOARD'S DAIRYMAN:—I want to build a silo. I have about 20 head of cattle in all and want to build a silo to hold enough to feed the whole year, now will you please tell me how large to build?

Also, will you please tell me what kind of grass will do best, and which has the most feeding value blue joint or red top? I have several low marshy places which I ditched last fall and cleared and plowed up and want to seed them down. My intention was to sow oats as a nurse crop, and cut when it commences to head out, and seed to alsike clover, timothy and either blue joint or red top. W. N.
Cecil, Wis.

If we estimate an average of 35 lbs. of silage daily, per cow, it will require 130 tons to carry 20 cows through the year, and making allowance for waste and small increase in number of animals, the silo should have a capacity of nearly or quite 150 tons. A round silo, 18 feet in diameter and 30 feet deep, or one 20 feet in diameter and 26 feet deep will have such capacity. In either case there would be more surface exposed than is desirable. Two silos, 15 feet in diameter and 26 feet deep would give better satisfaction.

There is considerable difference of opinion as to the adaptability and feeding value of blue joint hay. It is a native grass and some authorities claim that it does not do well under cultivation. Others recommend it very highly. On the whole, it would appear that the red-top should be preferred.

Further Facts Wanted About Silage and Silos.

ED. HOARD'S DAIRYMAN:—I read in John Gould's article, page 52, in the Feb. 27th number of your paper, that Joe Wing fed 60 steers, 700 eight-months-old lambs, for 70 days on 10 acres of ensilage and it was not all gone. Now to the uninitiated, this sounds fishy indeed, but if Bro. Gould or Wing will tell us just how much dry feed and how much grain was fed with this ten acres of corn, we might be able to approximately figure out the real worth of this ensilage.

I will take my initiatory degree in silo construction and use this season. Have the material on the ground, for stave silo 13x26 feet, will use the built-up wooden hoops, nailed on. Will try some clover in it for feeding after harvest, and corn in the fall. Will report my suceess or failure in the future. G. C.
West Unity, Ohio.

The amount of silage fed to those steers and lambs probably did not exceed 160 tons, and is quite practicable to raise that amount on 10 acres of fertile land, properly cultivated. After G. C. has mastered his "initiatory degree" in silos and silage, John Gould's statement will appear credible, and we shall await with much interest the promised report of his success.

WORCESTER SALT
IS THE BEST

The largest Creamery in the world uses WORCESTER SALT, and—this telegram tells the rest:

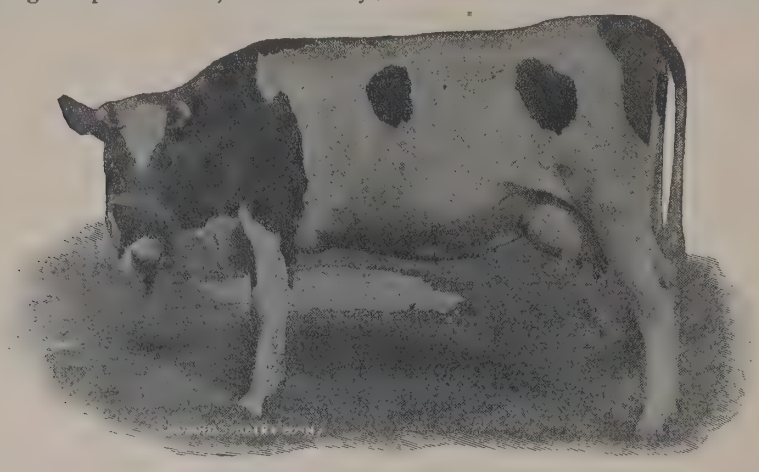
FARMER BRIGHTON, FAIRFIELD, IOWA.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.



Cornish, Curtis & Greene Mfg. Co.,

Public Sale of High-Class Holsteins.

In a personal letter to the DAIRYMAN, Mr. C. F. Hunt, whose sale is advertised to take place at Syracuse, N. Y., April 22, 1903, assures us not only that all the animals are strictly high-class both in breeding and performance, but that they are individually excellent types of the breed and the families they represent.

In confirmation of these statements, he refers to the Holstein-Friesian Advanced Registry Official, citing the record of each animal, from which it appears that 5 mature cows are credited with an average yield of 19 lbs. 2 3-5 oz.; 3 4-year-olds, 18 lbs. 2⅔ oz.; 6 3-year-olds, 16 lbs. 6 oz. and 10 2-year-olds, 12 lbs. 12 3-5 oz. This is an average for the 24 head, nearly half of them only two years old, of 16 lbs. 10 oz., or 1 lb. 10 oz. more than is required for mature cows.

In further assurance, Mr. Hunt sends us photographs of two of the animals, which we reproduce as object lessons of dairy type, well worthy close study by every dairyman who has an ambition to improve his herd and increase his profits. No matter what breed one may select, there is a pronounced similarity of form in all first-class dairy animals.

Handling Manure.

ED. HOARD'S DAIRYMAN:—I would like to ask the many writers who are advocating drawing out manure and spreading it in the snow on frozen ground, a few questions.

Why is the fertility washed out of a pile of manure by the small amount of water that falls on the few square yards covered by the pile, more than it is by the tons of water that fall on the two or three acres that they would spread the pile on? If the fertility will wash from the yard to the brook why not from the field to the brook? Why does it not settle down from the surface a little way into the pile and remain there just as they claim it does in the thin layer spread upon the field?

Of those who prove their theory by telling of the absence of any extra growth a short distance below manure spread on a side hill I would ask, What do they think will prevent the dissolved fertility running way to the foot of the hill when it has once started?

If there was an extra growth below the manure it would prove that it did not all run away. Do they think water will sink into a frozen soil? Water always stands in depressions until the frost is out beneath it. We are taught that much of the soil was made by being washed from other places. If the fertility does not wash also why are the hollows and low places where water accumulates and stands in the spring always richer and more productive than the surrounding soil?

If nothing but the coloring matter runs away, what is the grey powder-like substance that covers the grass in a dried out depression immediately after the water recedes and before the rain has washed it off? I think it is not quite all tannin. I would like very much to be convinced that I will gain by spreading manure on snow and frozen ground, but how the snow that usually goes off with a rain can run off of a field carrying one soluable substance and leave another, is more than I can comprehend.

Plattsburgh, N. Y. PAN DAY.

Fawn Color, Stubby Tail, Deficient Rudimentaries.

I purchased a bull calf, 18 months old, without examination, knowing his ancestors as prize winners for years of this section, and dam as a model dairy cow of great ability, but on arrival of calf find it of fawn color, rather of a stubby tail and scarcely no teats, but other ways consider it a model. Would like to know if it would pay to sell him and purchase another or try him and see his stock?

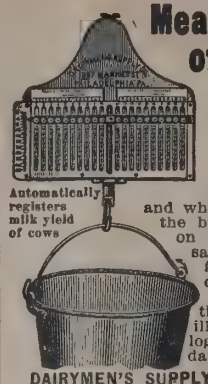
Kendallville, Indiana. A SUBSCRIBER.

We do not consider that the objections stated are fatal, especially when offset by a dam of such merit. It is not so much the size of the rudimentary teats that should govern as it is the manner in which they are placed. We like to have them well spread and squarely placed, indicating that the resulting heifers will have shapely udders and well placed teats.

A New Dairy Law In Wisconsin.

The following law relative to the taking of milk to creameries, and the action of the creamery operator in testing the same, has been recently enacted by the Wisconsin legislature and is now in full operation.

THE PEOPLE OF THE STATE OF WISCONSIN, REPRESENTED IN SENATE AND ASSEMBLY, DO ENACT AS FOLLOWS:



SECTION 1. In the use of the Babcock test, the standard milk measures or pipettes shall have a capacity of 17.6 cubic centimeters, and the standard test tubes or bottles for milk shall have a capacity of 2 cubic centimeters for each 10 per cent marked on the necks therof; the standard unit of cream for testing shall be 18 grams, and it is hereby made a misdemeanor to use any other standards of milk or cream measure where milk or cream is purchased by or furnished to creameries or cheese factories and where the value of said milk or cream is determined by the per cent of butter fat contained in the same, or wherever the value of milk or cream is determined by the per cent of butter fat contained in the same by the Babcock test.

Section 2. Any manufacturer, merchant, dealer or agent in this state who shall offer for sale or sell a milk pipette or measure, test tube or bottle which is not correctly marked or graduated as herein provided shall be guilty of a misdemeanor, and upon conviction thereof shall be punished as provided in section 4 of this act.

Section 3. It shall be unlawful for the owner, manager, agent or any employe of a cheese factory, creamery or condensed milk factory to manipulate or under-read or over-read the Babcock test or any other contrivance used for determining the quality or value of milk or cream or to make any false determination by said Babcock test or o herwise.

Section 4. Whoever shall violate any of the provisions of this act shall be guilty of a misdemeanor and upon conviction thereof shall be punished by fine of not less than twenty-five dollars nor more than one hundred dollars for each and every offense, and in default of payment thereof shall be imprisoned not less than thirty days nor more than sixty days.

Section 5. This act shall take effect and be in force from and after its passage and publication.

Measure the Milk of each Cow

With the **Automatic Milk Scale** you can keep an accurate record of the yield of each cow, and remove the unprofitable ones from the dairy. Each button on scale arm corresponds to number of cow, and when pail of milk is weighed the button registers the weight on score card. Big money saver and money maker for farmers and dairymen.

Send for testimonials and illustrated catalogue of **Bestov** dairy supplies.

ILLUSTRATION.

THE GREAT WESTERN MANURE SPREADER.

In no line of machinery made to meet the various necessities of the farmer has there been such marked progress in late years as in the matter of mechanical spreading of manure. This thought is brought to mind by seeing the catalog of the Smith Manure Spreader Company of Chicago, upon their Great Western Endless Apron Spreader. For the reason that the spreading of manures by machinery is a matter of such great importance with farmers today, and for the additional reason that this spreader is in many respects typical of the best ideas employed in all spreaders, we desire to call the reader's special attention to it by illustrating it here. That manure may be made to cover more ground, that it is spread uniformly so that every particle may find its way into the soil instead of lying about in lumps and piles to waste away in rainy seasons, and that there is great saving of time and labor in the spreading by machinery, are matters which need no further discussion before intelligent farmers. It may be too early to say that the ideal machine has been produced, but in candor we must say that it is difficult to see how anything can more adequately serve the purpose than this Great Western Spreader. We gather from the catalogue, which we hope will find its way into the hands of many of our readers, that it not only spreads manure, but is equally at home in every kind of commercial fertilizer. It is regulated while in motion, to spread thick or thin as desired. It differs from all other spreaders in having an endless apron whereby it is always ready to load. Its combined hood and end gate serves the dual purpose of keeping manure from beater during loading process or in starting, and acts as hood and shield while spreading. What is designated as a non-bunchable rake serves to hold all chunks and hardened substances upon the beater until thoroughly pulverized and discharged as uniformly over the ground as the rest of the load. Its rated gauging is 3 to 25 loads per acre. All this and much more is set forth with proper detail in the Company's catalogue, to which we must refer the reader for further particulars. It is a book 10x27 inches in size, showing numerous large cuts. It is mailed free on application. Write for it and study the subject, whether you think of buying a spreader or not.

MR. STEPHEN HUG of Crystal City, Mo., is a great enthusiast on the subject of alfalfa says the *Farmer and Stock Grower*. He sows 30 pounds to the acre and attributes his success in dairying largely to the growing of this plant.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—Butter remained firm at 28½c on the Elgin Board of Trade today. No offerings were made and the market was quiet. The output for the week was 505,400 lbs. The New York market was reported firm at 29c. Former markets were:

March 30, 1903, no sales, price 28½c,
April 7, 1902, no sales, price 30c.
April 8, 1901, no sales, price 21c.
April 9, 1900, no sales, price 20c.

Elgin, Ill., April 6. H. C. B.

DAIRY MARKETS.

ELGIN, Ill., April 6—Butter—Sold at 28¼c on the Board of Trade to-day, the same price as last week. Sales for the district were 505,400 lbs.

CHICAGO, Ill., April 6—Butter—Firm; creameries, 18@28½c; dairies, 12@24c.
Cheese—Steady; Twins, 13@13¼c; Daisies, 13¼@13½c; Young Americas, 13½c.
Eggs—Firm at mark, cases included, 13½c.
Live poultry—Easy; turkeys, 12@13c; chickens, 13c.
Cattle—Prime beeves 1,200 to 1,400 lbs., 5.50@5.70; choice to extra beeves, 5.25@5.45; fair to good export and shipping steers, 4.70@5.15; medium beef steers, 4.25@4.65; plain to fancy beef steers, 3.80@4.00; common to rough, 1,000 to 1,250 lbs., 3.30@3.70; good to choice heifers, 3.90@4.60; good to choice feeders, 4.00@4.90; poor to plain stockers and feeders 2.75@3.00; fair to good cows and heifers 3.20@4.15; good cutting and fair beef cows, 2.65@3.15; common to good canning cows, 1.70@2.60; bulls, poor to choice, 2.25@4.25; veal calves, good to fancy, 6.00@7.00; calves, common to fair, 3.50@5.75; corn fed Western steers, 3.65@5.50; Texas bulls and grass steers, 2.75@3.20. Texas steers, fair to choice, 3.75@4.60.
Hogs—Good to prime heavy shipping, 7.35@7.50; good to choice heavy packing, 7.35@7.50; plain to choice heavy mixed, 7.20@7.35; selected butcher weights, 7.30@7.50; assorted light, 150 to 195 lbs., 7.00@7.25; common to good light mixed, 7.05@7.25; thin to choice, 50 to 130 lbs., 6.40@6.90; stags to rough lots, 4.00@6.25.

MILWAUKEE. Wis., April 6—Butter—Creamery—extras, 28½c; firsts, 22@23c; seconds, 17c; June creamery, 18@20c; process (renovated), 17@18c. Dairy, fancy, 19c; lines, fresh, 15@16c; roll, 15@16c; packing, 12½c: whey, 10c; grease, 5@6c. Receipts, 10,730 lbs.
Cheese—American full cream, Twins, 13@13¼c; Young Americas, 13@13¼c: Daisies, 13¼@14c; Longhorns, 12¼@13c; low grades, 10@12c. Brick, fancy, 13@13½c: low grades, 11@12c. Limburger, fancy, 12@12½c; low grades, 10@11c. Swiss, drum, choice, 14@15c; drum, No. 2, 12@13c; Block, choice, 12½@13c; do, No. 2, 10@11c.
Eggs—Strictly fresh laid, cases returned, 12½c; seconds, 8c. Receipts, 550 cases; Saturday, 740 cases.

SHEBOYGAN FALLS, Wis., April, 1—Cheese—21 factories offered 782 boxes of cheese on the Call Board today and all sold as follows: 42 Twins at 12c; 24 at 12¾c; 161 cases Young Americas at 12¼c; 202 Daisies at 13c½c; 353 cases of Longhorns, at 12¼c. Market active and demand good.

SHEBOYGAN, Wis., April 1—Cheese—Offerings and sales on the local cheese board were 8 boxes Twins, at 12½c; 268 Daisies, 13@13½c; 39 Young Americas, at 12¼c; and 160 Longhorns at 12¼@12¾c. The market was very active, the demand exceeding the supply. Dealers expect higher prices to rule this than last. The meetings of the board from now on will be held weekly on Wednesdays at 5 p. m. until further notice.

WASHINGTON, D. C. April, 6—Butter—Market very firm. Fancy Extras, 29½c.
PHILADELPHIA, Pa., Apr. 6—Butter—Market firm. Solids 30c. Nearby prints 33c. Western 31c.

NEW ORLEANS, La., April. 6—Butter—Creamery 29c. Renovated 19c. Ladles 14½c.
Eggs 13c.

CANTON, N. Y. April, 5—Butter—Offered 64 cheese and 343 tubs of butter. No sales of cheese. 27 tubs of butter sold.

KANSAS CITY, Apr. 6.—Eggs—higher; fresh Missouri and Kansas stock, 11½c. doz. cases returned; new No. 2 whitewood cases included, 12¼c. Butter—Creamery, 21@25; dairy, fancy 19c.

ST. LOUIS, Apr. 6.—Butter—Quiet; creamery, 21@29½c; dairy, 18@21½c.
Eggs—higher;; 12c for fresh.

NEW YORK, April 6—Butter—Receipts, 6,306 packages; market firm; state dairy, 17@27c; extra creamery, 29c; held creamery, 15@25c; creamery, common to choice, 19@28½c; factory, 13@16c. renovated, 12@18½c.
Cheese—Receipts, 1,541 packages; firm; new state full cream, fancy small colored, fall made, 15c; small white, fall made, 14¾c; large colored, fall made, 14½@14¾c; large white, fall made, 14¼@14¼c.
Eggs—Receipts, 22,191 packages; firm; state and Pennsylvania, 15@15¼c; western, storage packed, 15@15½c; western firsts, 14¾c; southern, firsts, 14¼c; Kentucky, 14¾c.

BOSTON, Mass., April 6.—Butter—Creamery western extra, 26½@27¼c; western firsts, 25½@26¼c, dairy, 24@25c; imitation creamery, 15@20c; ladle, 14@16c: box and print, 20@21c.
Cheese—Choice, 14½c; sage, 14½@15c; fair to good, 10@12½c.

TOPEKA, KAN., Apr. 4—Creamery butter 27½ to 29c; dairy 17½ to 19c.
Cheese—Longhorns 13¾c; Twins 13½c; Daisies 13¾c.

LIVERPOOL, April 6—Butter—Good United States, steady, 78s.
Cheese—Strong, American finest white, 69s; colored, 69s
Latest quotation for fancy creamery: Baltimore, 29½@30c; Cincinnati, 30½c; Newark, N. J., 29c; Buffalo, 29c; St. Paul, 27c; Minneapolis, 27c.

NEW YORK MARKET.

NEW YORK, April 4th.—Butter—Receipts for the week, 35,652 packages. Exports for the week, 2,361 packages.
All the arrivals of fancy fresh creamery were quickly taken at 29c and firsts cleaned up at 27@28½c. At the close there are very light stocks of extra fresh goods and prices are steady. Selections of finest dairy from Delaware county sold at 27@28c, while poor to good qualities from all sections sold at 15@25c. The best business of the week was in June make creameries. Long lines of the best creameries, perfectly kept, sold early in the week at 24@24½c, with sales later of several hundred tubs at 25c; also sales of good sized parcels fair to good quality at 19@23c, but the demand was largely for best goods suitable for table use and anything showing old flavor was either rejected or prices knocked down 4 or 5c per pound. Renovated butter of fine quality was in good demand at 19@20c, while under grades were entirely neglected and prices nominal. Low grades of butter continue in full supply and prices favor buyers. We quote:
Creamery, fresh, extra, 29c; medium, 26@28c; poor, 15@25c Creamery, June, extra, 25c; medium, 20@23c; poor, 15@20c. Dairy, extra, 27@28c; medium, 22@25c; poor, 15@20c. Ladle, extra, 20c; medium, 15@17c; poor, 12@14c. Renovated butter, 19@20c; medium, 15@17c; poor, 12@14c.
Cheese—Receipts for the week, 10,503 boxes. Exports for the week, 3,879 boxes.
Trading is confined to a small retail business and sales at 15c are too few to make it a quotation. Home and out-of town trade are buying good useful full cream cheese at 13@14½c, while exporters are taking under grades full cream and skimmed cheese at 10@12½c, and they would probably pay 14@14¼c for finest full creams, but holders refuse to take these prices, feeling confident that higher prices will be made before the new make. We quote:
Full cream, extra, 14½@15c; medium, 13@13¼c; poor, 10@12½c.
Eggs—Receipts for the week, 130,895 cases.
There is a good healthy demand and although receipts are unusually heavy, the top price is freely paid for good standard marks; prices close firm at 14½@15½c. DAVID W. LEWIS & Co.
177 Chambers St.

SOME BIG USERS
OF BOTH FARM AND FACTORY
CREAM SEPARATORS

As everybody knows all the big and long experienced users of Cream Separators are patrons of the **DE LAVAL** machines. Many commenced with other makes and nearly all have tried various different kinds, but practical experience in the use of Cream Separators always means the eventual use of **DE LAVAL** machines exclusively.

The names below are those of a few of the big users of separators—all having from 20 to 200 Power or Factory machines and hundreds of Farm machines with their patrons as specified—all **DE LAVAL.**

Beatrice Creamery Co., Lincoln, Neb	5,000 machines
Continental Creamery Co., Topeka, Kas	3,000 machines
Franklin County Creamery Ass'n, St. Albans, Vt	1,000 machines
Fairmont Creamery Co., Fairmont, Neb	1,000 machines
Littleton Creamery Co., Denver, Colo	1,000 machines
Manning Creamery Co., Manning, Iowa	750 machines
Faust Creamery & Supply Co., Salt Lake City, Utah	500 machines
W. G. Merritt, Great Bend, Kas	500 machines
Frank Dunning, Bedford, Iowa	500 machines
Nebraska-Iowa Creamery Co., Omaha, Neb	300 machines
J. A. Danielson & Co., Lake Park, Minn	300 machines
E. G. Hammer, Goodhue, Minn	300 machines
W. C. Lubke, Kenyon, Minn	300 machines

These are just a few of the big users of **DE LAVAL** machines all of whom are now busily engaged in putting out hundreds more of Farm machines among their patrons as fast as the Shops can produce them.

A De Laval catalogue may be had for the asking.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Three married men, with or without families, to work on large dairy. Must be good milkers. Salary $25.00 per month, house rent and fuel furnished. Give experience and all particulars. RICHLAND FARMS, Greensboro, Ga. 6-4

For Sale—Pure bred Guernsey bulls and grade heifers. Also Early Black Soy Beans at $2.00 per bushel. A. H. HINMAN, Neenah, Wis. 6-4

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

Guernseys For Sale—Six cows and seven heifers. All registered. Send for circulars. EDW. SHARPLES, Landenberg Pa. 7-tf

For Sale—1 DeLaval cream separator, Alpha No. 1. WEXFORD EXCHANGE, LTD., Wexford, Pa. 6-tf

The 'Business Herd of Holstein Cattle For Sale or Exchange—Having fifteen more cows than we can procure nearby pasture for, we desire to sell at once at their cash value, or exchange for horses, draft blood and brood mares preferred. If you desire some first-class cows of this breeding, with official records and breeding second to none, let us hear from you at once. F. G. JOHNSTON & CO., Sta. B, Columbus, O. 8-2

For Sale—One fine registered yearling Guernsey bull. Address S. L. DIETZ, Hyde's P. O., Md. 8-4

For Sale—One tract of 511 acres of land in Nottoway County, Virginia, forty (40) miles from Richmond, Va., lying along the Southern Railway, fourteen (14) trains daily north and south. It can be made a good dairy farm. For further information apply to T. O. SANDY, Burkeville, Va.

Position Wanted—As cheese or butter maker 20 years experience. Sober, married, no children. 685 Arkwright St., St. Paul, Minnesota.

For Sale—To settle estate, dairy farm and milk route, one and one-half miles from Mauston, county seat of Juneau County, Wis. 35 cows. 200 or 280 acres as desired, with fixtures and stock. Basement barn. There is good tobacco land on this farm. Enquire of B. N. SOUTHER, Mauston, Wis. Box 336. 9-5

For Sale—One Reid separator, capacity 2000 lbs. per hour, good as new. Also gang cheese presses, never been used, curd mill and vats. ALEXANDRIA CREAMERY CO., Alexandria, Pa. 9-3

Ayrshire Bull For Sale—Three years old. Sold to avoid inbreeding. Fine animal. Write. J. H. HARTEN, Densmore, Wells Island, N. Y.

Clydesdale Oats—A large heavy early oat, from seed imported from Scotland two years ago. 65 cents per bushel, bags included. Dwarf Essex Rape. Cow Peas and pure Buff Wyandotte eggs $1.25 per 15. B. F. WYMAN & SON, Sycamore, Illinois.

For Sale—U. S. Separator No. 6, $65.00. Dairy farm of 101 acres $4,000. M. R. BUCHANAN. Columbia, Tenn. 8-2

For Sale—Three registered Holstein bulls one year old; also a few heifers. FRANK BREWSTER, Bowers, Wis. 8-2

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

Guernsey Cattle—Clover Knoll herd. Send for circular. M. SAGER, Orangeville, Pa. 50-12

Swiss Cattle For Sale—As I intend to quit farming after this year, and am not situated so I can milk many cows this season, I will sell several cows and heifers and a few young bulls at very low prices for the quality of the stock. Come and see the stock and get prices. T. H. INMAN Hanover, Wis. 6-4

Wanted—Situation by expert retail dairy manager. All branches of the business thoroughly understood. Have references second to none. Address J. O. G., care Hoard's Dairyman. 8-tf

For Sale—Yearling Jersey bull ready for service. Dam tests 17 lbs. 7 oz. in 7 days. Sire, pure St. Lambert service bull in herd of E. R. Hicks. Price $50.00. GEO. A. BUCKSTAFF, Oshkosh, Wis. 8-2

For Sale—Salem's King, 5362, A. G. C. C., 5 years old. A. PARKS, Pickett, Wis. 8-2

Very Low Rates to California and Return—Via the North-Western Line First-class round-trip tickets on sale May 3d and 12th to 18th, to Los Angeles and San Francisco. Favorable limits and stop over privileges and choice of routes. The overland limited, most luxurious train in the world, leaves Chicago daily 8:00 p. m. Less than three days en route. Drawing room and compartment sleeping cars, observation cars, dining cars, buffet-library cars, (barber and bath) electric lighted throughout. Three trains a day from Chicago to the coast through without change. Daily and personally conducted tourist car excursions to California, Washington or Oregon. For particulars apply to ticket agents Chicago & North-Western R'y. 8-7

Half-Rates to New Orleans, La.—Via the North-Western Line. Excursion tickets will be sold at one fare for round trip April 11, 12 and 13, limited to return by special extension until April 30, inclusive, on account of Annual Convention National Manufacturers' Association. Apply to agents Chicago & North-Western R'y. 8-2

Very Low Rates to Dedication Ceremonies of Louisiana Purchase Exposition, St. Louis, Mo.—Via the North-Western Line. Excursion tickets will be sold for the above occasion April 29, 30 and May 1, and on account of Good Roads Convention on April 26 and 27, all with return limit until May 4, inclusive. Apply to agents Chicago & North-Western R'y. 9-4

To Colorado in 1903—The passenger department of the Chicago & North-Western Railway has issued a very interesting folder, giving information as to reduced rates and sleeping car service, with a short description of the various points of interest in Colorado usually visited by tourists, these excursion rates applying on account of the Christian Endeavor meeting to be held at Denver, July 9th to 13th. Send 2 cent stamp for copy, to W. B. KNISKERN, Passenger Traffic Manager, Chicago. 9-6

The Feeding Value of Malted Grain.

ED. HOARD'S DAIRYMAN:—The following inquiry has been forwarded to me:

"Will Prof. Woll kindly give the writer his views or discuss them in the DAIRYMAN on the gains and losses to the practical feeder from sprouting the corn as proposed by the American Grain Growing Company which had tests of feeding stock on sprouted corn at the stock yards last fall. These were carried up to a development of considerable chlorophyl, I believe. F. E. E.

Bloomington, Ill.

The method of sprouting corn for feeding purposes was, so far as I know, first recommended last fall by an enterprising Chicago firm, who presumably expected to reap a fortune in selling the necessary apparatus. The method did not seem to take, however; no doubt because the agents could not point to any experiment station or authority on feeding problems to back up their extravagant claims. It is difficult to see how the public at the present time, can believe in any new food or method of preparation which has not been endorsed by some disinterested scientist or public research institution, on basis of actual trials made. This statement does not refer to condimental stock foods, which are not new aud which are apparently sold in as large quantities as ever, in spite of the testimony as to their general worthlessness which is accumulating, and in spite of the position which every authority on the subject of animal nutrition has taken, who has expressed an opinion as to their use.

The method of feeding sprouted corn is not to be classed among food frauds, however, except in so far as unwarranted claims were made for the method. The question is entirely parallel to that of the relative feeding value of unmalted and malted barley, and this was settled by Lawes and Gilbert in England more than forty years ago, in a number of experiments that are generally considered classic, and have rendered useless further experiments on this point. These scientists found that a decided loss in feeding value took place in the malting process; it was shown in feeding experiments with milch cows, steers and sheep, that "a given weight of barley is more productive, both of the milk of the cows and of the increase in the live weight of fattening animals, than the amount of malt and malt sprouts that can be produced from it." There being no advantage in point of gain in milk and flesh, there must be a loss in point of economy on account of the expense of the malting process; irrespective of economy, the report of the experiments concludes, malt is undoubtedly a very good food for stock; and common experience seems to show that a certain amount of it is beneficial when given in admixture, and in change with other food, to young or weakly animals, or in "making up" or "finishing" for exhibition or sale; that is, when the object is to produce a particular result irrespective of the economy required in ordinary feeding."

This also, to my mind, states the case so far as the method of feeding sprouted corn is concerned. Some advantage might be secured by feeding sprouted corn, from a resulting improvement in palatability or the digestibility of the food. In both these respects there is no great chance for improvement, however, since farm animals prefer grain to almost any other food, and the cereals furnish about 90 per cent of digestible components as ordinarily fed. Any slight advantage that may be gained is at any rate more than offset by the cost of sprouting the corn; both by the first cost of the germinating pans and the cost of the large amount of labor required for preparing the corn in this manner. I do not, therefore, believe that your correspondent will get his money back if he should invest in an outfit, and would advise him to leave the company alone.

***

DENMARK AS A MODEL.

Permit me to correct the reference in this week's DAIRYMAN to the paper on "Butter Contests in Foreign Countries," which I read at the Waukesha meeting of the Wisconsin Buttermakers, Association. You say that I quoted the adage, "Do as Denmark does and you are all right" to up-hold my lavish praise of the business of that country. Now, that is exactly what I did not do; the opinion has been frequently expressed in dairy papers during late years that since Denmark occupies a leading position in the dairy world, everything that comes from that country in the line of dairying must be all right and the best thing our dairymen and particularly, our butter makers, can do, is to try to go in the foot-steps of their Danish cousins. I showed in my paper that this is not sound advice; that conditions in this country and in Denmark differ greatly in many respects and it is necessary to take this fact into consideration before Danish dairy methods or appliances can be recommended to our dairymen; that is, the position taken was just the opposite of what you make it appear.

As to having bestowed any lavish praise on the business in that country, I plead not guilty, also to that charge. When a small country like Denmark has been able to increase her butter production four fold in the course of the last 15 years or less, and has reached a stage where an annual revenue of over $400,000,000 is obtained from the butter product alone, the facts speak for themselves and it is not necessary to resort to rhetoric.

F. W. WOLL.
Wisconsin Experiment Station.

Combined Conveniences on a Dairy Farm.

What has Been Accomplished by One Delaware County Farmer.

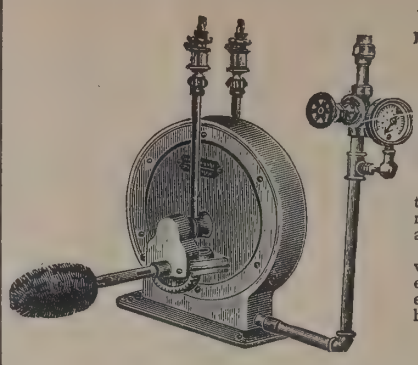
ED. HOARD'S DAIRYMAN:—The name of John T. McDonald (Delhi, Delaware county, N. Y.) is not an unfamiliar one to older readers of HOARD'S DAIRYMAN.

For his large and excellent dairy farm, located in the Elk Creek valley in the town of Meredith (Delhi P. O.) has been frequently referred to in your columns and a more or less extended description and outline of his farming methods given by your former contributor, the late J. D. Smith.

It is not however with a view to entering into a discussion or giving any details as to farm management by this successful farmer (for that he has been successful in this direction will be generally conceded) but rather to give briefly a sketch showing what he has accomplished in the line of securing a class of conveniences such as I believe can scarcely be found elsewhere in all the farming regions of Central New York at least, and certainly not upon any farm where the capital required to secure the same has been made upon the farm and from the legitimate proceeds of the dairy that has been kept thereon.

The farm known as "McDonald Dairy Farm" J. T. McDonald proprietor, was settled by the father of the present owner, and came into his possession about the year 1875.

It contains about 200 acres, in the home farm, part of the dry stock kept is pastured in the summer on a wood lot, on an adjacent farm, and at that time kept about a twenty-cow dairy besides a few sheep, while now the usual dairy kept by him here, comprises about 90 cows. A large proportion of what is now the best meadow land upon the farm, was then a swamp and covered with pine stumps and the reclamation of this land and converting it into meadow has had much to do with so greatly increasing the stock keeping capacity.



Mr. McDonald saw here an opportunity to take advantage of the benefits of the great natural fertility of such a soil by proper management and it is doubtless his aptitude to take advantage of the forces of nature placed at his hand and using the necessary means to bring them under control, combined with a natural mechanical genius, that more than anything else has contributed to his success.

A moderate sized stream of water running through the farm, is so utilized by holding the water in dams, that there is always sufficient water power for doing the work desired in the mill upon the place.

This mill is equipped for sawing and feed grinding, besides a complete outfit of box-making machinery, where are made all the boxes used in the shipment of butter, eggs and other products of the farm.

Connected with it is also a shop well fitted up with tools of all kinds necessary for the various kinds of work done here with planing machine, cider mill and press, etc, so that it is seldom necessary to leave the farm for any job of work such as is ordinarily taken away from home by the average farmer.

Adjoining the large and convenient dairy barn is a completely equipped

Very few milk depots are without a liberal supply of steam, although not many have power.

OUR IDEAL TURBINE BOTTLE WASHER

Enables those having steam plant only, to utilize this for bottle washing purposes. Very little steam is required. The Turbine wheel is good weight, acting as balance wheel.

The Washer is complete with steam inlet, piping, valve, steam gauge, siphon, sight feed oil cups, etc., etc., also new style brush spindle, and one each of our Gray, Bristle, and "Ideal" water-proofed handle bottle brushes, cut to fit machine.

creamery fitted up with all modern conveniencies for butter making. A twenty-five horse power boiler with a ten-horse power engine furnishes the motive power required here, and besides is used to boil sap in the season of maple sugar making (a considerable amount of sugar and syrup are made upon the place and furnished to their city customers in connection with the butter, eggs, etc., shipped from the farm) to steam feed in winter for the dairy and with a steam valve arranged in the dairy room, for scalding and cleaning the dairy apparatus used therein, is thus utilized in various ways.

Attached to the creamery is an ample cold storage room adjacent to the churn room, the ice house which extends over a part of this churn room, holding about 125 tons is refilled in August from the large one outside which has a capacity of from 300 to 400 tons.

This of course has a tendency to greatly modify the temperature in the churn room giving very nearly ideal conditions for best results in butter making.

The butter is put up in small prints and sent direct to families in different cities with express charges prepaid and this method has proved very practicable and satisfactory.

He also furnishes fresh eggs, poultry etc. to the same customers shipped in the same manner as the butter. From seven to ten men are employed upon the farm throughout the year.

The water supply for all the farm buildings—including besides the large and fine residence and out buildings, three well built new cottages erected during the past year for the accomodation of families of laborers employed upon the farm—is brought to the house in 4 inch cast iron pipe from a reservoir holding 1,000 bbls. or more. A number of living springs are conducted into this reservoir, which is situated at an elevation that gives 100 lbs. pressure.

The one thing, however, of all the rest that is perhaps most out of the ordinary, or unusual to be found upon a dairy farm is the complete system of electric lights recently put in here by Mr. McDonald.

Asked if he thought it would be found practicable for the average farmer who has water for the motive power, to light his home and farm buildings with electricity, and if it can be done at reasonable cost, he replied: "It has proven very practicable for me. I have been using it for three years, and there is no other investment I have ever made that pleased me as well.

"I put in a 50 light dynamo at a cost of $300 for the dynamo and the whole system of wiring all the buildings was completed for about $100 dollars additional, or $400 in all.

"And it is I can assure you a wonderful convenience; no one can appreciate its real value in this respect until he has tried it.

"We have it in our stables, about twenty jets or sixteen ligths in different parts of the stable, and thus furnish the most complete lighting arrangements conceivable.

"We have a voltage indicator in the kitchen by which we regulate the power of current, and all the care required is to watch the indicator and change the voltage to correspond with the number of lights that may have been either turned on or off, so as to give necessary voltage.

"With two wires drawn tightly on a sweep and so arranged with a gate that the gate, being very sensitive to the slightest change, may be easily managed, it is readily controlled without leaving the kitchen.

"By this arrangement we find the trouble of running our lightning system for the whole place is comparatively nothing.

"And so highly do I value it, that perhaps I am too much inclined to brag about it.

"I believe that any farmer who has a stream running through his farm, that by damming up and storing the water, he can secure the power with which to light his house and farm buildings by electricity, will find that it can be done, not only at a reasonable cost, but that it can be made a most economical method of furnishing the required light."

NEW YORK.

How a Creamery Pays for Cream.

This question is submitted by a reader in Chemung county, New York, who wants to have a co operative creamery in his neighborhood, which has hitherto taken only milk, receive his cream. We judge, from the general tone of his letter, that this creamery does not, as it should, use a Babcock test for determining the varying qualities of the milk. Where cream is supplied, a Babcock test is indispensable. By its use the amount of fat in the cream is ascertained, and by adding 18 per cent, the amount of butter. Deduct from the current price of butter, the proper charges for making, which will be from 2½ to 4 cents per pound, depending upon the amount of business done, and the net price to be paid the patron for each pound of butter, will be ascertained.

Indian Wheat.

ED. HOARD'S DAIRYMAN:—Please tell your New England subscribers they can obtain as good results to feed their cows Indian wheat meal with hulls sifted out, as they can with cotton seed meal. At least that is the experience my neighbors and myself have found this winter.

Windsor Co., Vt. C. N. COWEN.

List of Tests Accepted for Publication by the American Jersey Cattle Club.

Honesdale 147772—Sire Coomassie's Triple King 37939; dam, Capote 115608; fat, 12.305 lbs.; milk, 228.6 lbs. Test made from Feb. 19 to 25, 1903; age, 5 years; actual weight, 950 lbs.; fed corn ensilage, shredded corn stover, clover hay, corn and cob meal and cotton seed meal not weighed.

Pet of Suncook 137782—Sire Exile of Maine 36332; dam, Suncook Girl 137605; butter, 16 lbs., 1½ oz.; milk, 294.6 lbs.; test made from Jan. 26 to Feb. 1, 1903; age 6 years, 7 months; estimated weight 850 lbs.; fed 3 pounds dried distillers grains, 3½ pounds wheat bran, 3½ pounds cotton seed meal, 3½ pounds corn meal and 35 pounds roots daily hay and cured ensilage corn *ad lib.*

Rioter's Lorlie 135359—Sire Rioter of Macome 40448; dam Lorlie Vayne 2d 89187; butter 16 lbs., 1 oz.; milk, 268 lbs., 10 oz; test made from Mar. 25 to 31, 1902: 5 years, 7 months; estimated weight, 1,000 lbs.; fed 14 pounds linseed oil meal, 42 lbs. coarse middlings, 14 lbs. corn meal and 245 lbs. corn ensilage; hay *ad lib.*

PRIZES TO COOKS.

$7,500.00 in Cash to be Distributed.

Between now and July 1st, family cooks, whether employees or the mistress of the household, will be following the plan laid down for improvement in cooks in a contest for 735 cash prizes ranging from $200.00 to $5.00 offered by the Postum Cereal Co., Ltd.

The winners must show improvement in general cookery as clearly stated in the rules for the test.

No one has to buy or pay anything whatever. It is simply an earnest effort on the part of Mr. Post to stimulate the household cook to more careful and skillful cookery.

To have light, sweet bread and cakes instead of heavy, sour and indigestible things. To have no more greasy, burned or dried-out meats. To have properly made Coffee, Postum and Tea. To have delicate and digestible, toothsome deserts and a table, clean, tasty and a pleasure to look upon.

And so $7,500.00 in actual money will be spent to encourage the cooks of the country to better effort. And you housekeepers, please forever abandon the term "hired girl." Teach your cook the dignity of her profession, call her the cook.

If her duties include other service, well and good but don't detract from her professional title by calling her the "hired girl," That term don't fit a good cook. A certificate bearing the large seal of the Postum Cereal Co., Ltd., will go to each of the 735 winners in this contest. These certificates or diplomas will be as valuable to the holders, as a doctor's sheepskin is to him.

A postal card to the Cookery Dept. No. 388 of the big pure food factories of the Postum Cerial Co., Ltd., at Battle Creek, Mich., will bring a sheet of plainly printed rules for the contest.

The National

The Dual-Purpose Cow.

ED. HOARD'S DAIRYMAN:— We seldom pick up a paper without seeing an article on the Dual-Purpose cow and the breed or combination of breeds best calculated to produce her. The dual-purpose cow confronts us in the agricultural and dairy papers, and in the agricultural columns of the weekly newspaper but seldom in the dairy. After reading the articles from the pen of Prof. Shaw and other writers of note, I hesitate to express my opinion in a paper so widely read as is the DAIRYMAN, but I feel that the working farmer has more at stake and more right to the real facts than any one else. I criticise no man, but desire information, as life is too short to go on a wild goose chase along dairy lines.

I am aware that it is very easy to warm one's self up in praising a breed or combination of breeds in which one is especially interested and to make a plausible showing of reasons for what will not stand the test of time or practical experiment. The course of events of the last few years has turned more attention to dairying than ever before.

No dairyman who has suitable land and fixtures for his business is called upon to give up the avocation he best understands to embark in beef raising.

The recent boom in the beef market has caused many dairymen to look around with a view of securing a cow that, when her term of usefulness in the dairy has expired, will dress half a ton of steer beef. They overlook the fact that a cow of the dairy type was never intended to make heavy beef, and is almost without exception thin meated. She may be made fat, but you can never get the lean to correspond with the fat, and the percentage of high priced cuts that the market demands. She can be worked off, however, and in a year like the one just past will command a fair price, for some people who cannot afford choice beef will want her. But it would be a losing game to raise her for beef.

No one will deny that that there are cows which perform well in the dairy and possess sufficient size for beef, but we have no assurance that her descendants will have the same traits. They are more apt to run to beef than to milk or butter. We are told that in breeding for any desired result we must rely upon that system or order of nature which produces checks or corrects against a preponderating ascendency of any one department or creation to the ruin of another.

Each one of the recognized dairy breeds is said to have proclivities not supposed to be possessed by the other and we read that there is nothing gained by crossing, but rather a loss. A farmer's cash income depends on his skill as a cultivator, success as a dairyman, fruit grower, wool grower or breeder, and the better he understands his special line, the greater will be his success. Dairying consists of butter making, cheese making and the production of milk for the trade and it would seem to be good business policy to select stock best suited to each particular line.

Though farmers as a rule are slow in the introduction of new ideas in their methods of business, it is gratifying to note a decided increase in the demand for the special-purpose cow. Personally, I champion no breed. I want the cow, not the breed. She must eat and respond to the rations laid down in the DAIRYMAN and leave me a good profit for my feed and labor. While I prefer her to be of medium size rather than small or over grown, if she is an economic producer and a persistent milker, I shall not question her size, color, nationality, religion or politics.

I confess I should like to own—if my finances would permit — a herd of thoroughbreds, and it would give me pleasure to have their pictures appear in the papers and packages of cigarettes, but blood or pedigree would not keep them from the block if they failed to connect. If dairymen must have beef, let them raise their steer calves. They can get beef from a dairy steer, but it will keep them guessing to get a dairy cow from a beef steer and very seldom one from his mother. J. HOWARD.

New York.

Feeding Before or After Milking—Carbolic Acid for Abortion.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of March 13th, B. & B., of Dermott, Ark., wishes to make a change from feeding at milking time to either before or after milking, because he says it is quite a burden to feed each cow at time of milking. If it is the grain feed he has reference to, I wish to say that we have fed our grain ration at milking time for the last eleven years, and have milked as high as twenty-nine cows. Our method is to have a feed bucket for each milker and keep the feed near where we weigh and strain the milk. In this way, very little time is lost, and there is no trouble about the cow "giving down." A person soon gets on to the way of easily carrying milk bucket, stool, feed bucket and cloth with which to wipe udder. We milk in the barn the year round. When the weather is fine in the summer time, each cow is called into the barn and milked and turned out at once. Each cow knows her name as well as a person knows his and comes at once at call. They are alway milked in regular order and some of the cows will stand near the door and watch for their turn, and come in without being called, knowing when a certain cow is turned out that it is their turn. This we think is easier than running all over the corral to milk. When grass is good we only feed a very little bran, less than a pound, just enough to please them.

We have been having contagious abortion in our herd, and have found it very convenient to give the carbolic acid treatment in the grain fed (bran) at time of milking. Our plan for giving the acid is to take half as many pint milk bottles as we have cows to treat, and fill them about two-thirds full of warm water, using a medicine dropper to measure the acid. Twice full of the size we have makes a trifle over one-half dram; there is no danger in feeding this much. This we put into the bottle of water, and pour over the feed, but do not mix. We give the acid twice a day every other day, treating half of the cows one day, and the remainder the next day. We have great faith in the carbolic acid treatment, as with it we are having good success. We will give you our experience later on. We feed the acid from about the fifth month to within two or three weeks of calving. GEORGE W. DANA.

Deer Lodge, Mont.

What a Missouri Dairy Farmer Can do.

The Monroe City, Mo. *Democrat*, has the following to tell of what a plucky farmer, Mr. J. A. Bixler, near that city has done.

Saturday the pencil pusher got next to him and opened up on butter. There we found him at home and was surprised to learn the extent of his butter making. He uses a seperator. Last year was a drouth year, but in spite of

SOAP MAKING AT HOME

One can of *Banner Lye*—10 cents—will make ten pounds of the best hard soap—better than you can buy.

It takes less time to make soap with

BANNER LYE

than to make bread, and it gives you the purest soap, with absolutely no danger to person or clothes. Not old-style lye, but *Banner Lye*.

It also makes twenty gallons of soft soap.

EASY CLEANING

Cleanliness is a new word since these days of *Banner Lye*. *Banner Lye* washes away the dirt that you see and the dirt that you can't see. This last is most dangerous. It spoils the milk and butter in your bottles and jars, and when hidden in your drains and cellar invites disease.

Banner Lye cleans out all this dirt and the disease germs therein contained. You will be surprised at the difference it makes. It is odorless and colorless.

Get it of your grocer or druggist. He can easily get it of his wholesaler, if he hasn't it already.

Write for booklet "*Uses of Banner Lye*"

THE PENN CHEMICAL WORKS, PHILADELPHIA, U. S. A.

BERKSHIRES. We are breeding Imported boars on Gentry's great Duchess sows, weighing 600 pounds. Our herd is very select, every animal a gem. All our choice pigs of 1902 farrowing have been sold. We are now taking orders for 1903 farrowing.

Also Headquarters for Large English Berkshires and Standard Poultry.
Apply to
BILTMORE FARMS, BILTMORE, N. C.

that fact J. A. Bixler did not "lie down," nor did his ten cows go dry, for he made the best out of the situation, he could, and that means he made 2,400 pounds of fine good rich sweet butter, butter that is so that it does not go begging on the market, but is takan by regular customers—consumers—the year around at a stipulated price.

This year he will add two more cows to his herd and expects to make 3,000 pounds. Mr. Bixler also raises a large quantity of strawberries and other small fruit, which brings him several hundred dollars each year.

SHADY NOOK HERD Holstein Friesians offers three bulls one year old. O. I. C. White Pigs, both sexes. White Cap Yellow Dent Seed Corn, $1.50 per bushel.

Notes from New York.

Farm Separators.—Farm Butter.

ED. HOARD'S DAIRYMAN:—So much is being said through the columns of the DAIRYMAN about the introduction of hand separators on the farm in creamery localities that I feel impelled to write something concerning them. We have been using our machine seven years and have not in that time milked over eight cows and some of the time only six. We have used the machine when we only had milk enough to pay to run it only every other day, then again once a day and finally twice each day as more of the cows freshened. All that is necessary is to keep the milk sweet and skim off the cream that has raised, then warm up the milk to the desired temperature and run it through. The agent who set up the machine said "we might as well run through the milk you already have on hand" set in shallow pans. So we took all the milk that was not already thick and skimmed it.

A separator will skim under almost all conditions and all kinds of milk, no matter whether it is from cows that have lately freshened or are quite advanced in lactation, depending of course on the judgment of the operator as to the closeness of skimming. We govern our cream screw by the slop of the cream in the churn and the ability to whip easily with a little age; as we sell considerable cream we have to supply a cream to our customers that will whip readily. One of the principal points in cream separators is ease in keeping them clean. Now we wash our machine every day, but during the fall, winter and cool spring weather we only wash it once a day.

The bowl empties at the end of each separation and we flush it out with milk, but as soon as warm weather sets in we wash it at night with the skim milk, that saves a fire for the women folks at night, and keeps the parts from rusting which they would do if washed in cold water. If the bowl remained full of milk or water, why I should certainly wash it after each separation.

I should select a separator that had few parts and intricate pieces and places to keep clean as they are at best a filthy, dirty machine inside and out, and requires close attention in order to insure their doing good work. Durability, one with few wearing parts, parts to get out of order, as a break down, necessitating sending the machine back to the works to be repaired would be a great loss as well as inconvenience and should be considered when buying a separator. I should certainly buy a machine with closed gears, no cog wheels where little fingers could possibly get into them. Small children like to play with machinery and I know of one little fellow that nearly lost two fingers in a cream separator. Fingers that were worth more than the difference in the price of the better machine ten times over.

CLEAN SKIMMING.

That is what you will buy the machine for. Insist on trying it, and if it doesn't do a good clean job, why don't buy it. Of course you must furnish good clean milk, milk that has no garget, or fever or pieces of that other stuff in it. A separator cannot possibly skim clean unless the milk is right, the impurities will soon close or partially close the tubes and the cream will be apt to go with the skim milk. In other words the separator will make you take better care of your cows, be more careful about your milk and better cows and better feed will incidentally follow,

Dairymen, look for a separator that combines the most essential points in their mechanism. Don't let a few dollars decide the machine you will buy. If you select a first-class one at the start it will last a long time. Simplicity, durability and one that skims closely, are the most essential points to be considered in farm separators.

The first thing that comes to our mind in thinking on this subject as founded on our own experience is making a gilt edge product, one that will command the best price. The anxiety we had when we purchased our separator and churn and took the first butter to market can never be forgotten. We expected to furnish table butter for a millionaire summer resident trade, people who have palatial homes on our beautiful St. Lawrence River, and we knew that nothing but the best would go.

Our experience had been along the line of shallow pans and the dash churn. Granulated butter, starters, etc., were as Latin to us. HOARD'S DAIRYMAN was not know to us, neither did we read any agricultural paper, yet we recognized the need of more knowledge quite acutely; but there seemed no way but to go ahead and keep trying until we reached the goal. We made a couple of jars for ourselves, in small churnings, watching everything minutely to see where we could make an improvement. At last we took a couple of small jars to the middle merchant, for his inspection and he pronounced it all right.

If I were going to instruct a beginner in buttermaking, I should make first point cleanliness. Cleanliness all the way from the feed of the cow to the consumer, and the place where they kept the butter until it was used up. My neighbors used to criticise me for carding my cows; they said they rather "sit by the stove and roast their shins than in the stable with their cows," so they roasted and I still continued to card, unheeding their comments. Clean feed, clean cows, clean water, clean utensils, clean salt.

Second point: Temperature—We lower our cream into the well through a trap door made for that purpose during the warm weather. We never mix the cream until it is cool with the rest. Somehow, I think it makes a butter with a better body than it did when we did not cool it immediately from the separator, and another thing, it will keep the cream from ripening until you want it ripe; then again, don't put in cream at least 24 hours before churning. We found that out with the scales. Temperature regulates the length of time it takes to churn. We calculate that twenty-five minutes is about the proper time it takes to recover practically all the butter from the cream with our (barrel) churn. A churn with some interior devices might agitate the cream more and churn quicker with equally as good results. But we selected a barrel because we wanted that granulated butter that we had heard about. Temperature gives body to the butter.

One of our customers yesterday said: "We find your butter cheaper than any other we can buy, it goes farther, is firmer, has a better body, contains less moisture." A little mixture of Jersey cows among the others helps out, and makes a better body to the butter, make less work at the churn.

Third point: Ripeness for Flavor—I don't think that we ripen our cream as much as many who write for the papers claim they do, as we never let it get very thick. Perhaps it is because we stir up the cream every time we add any to the pails. We used to be troubled with curd, casein, in little flat particles in the butter after it was churned, and we laid it to running a thin cream and letting it get over-ripe. We have not had any trouble from that source in a couple of years. Starters we do not use; we ripen our cream by setting it in a warm place. The man of the house don't smoke, and we eat sour-kraut raw, so that odors are unknown. Bitter cream is an unknown thing with us. We don't let it get age

---

"ADVERTISEMENT."

WOULD YOU

Blame Him?

The effect of coffee on brain workers is more injurious than on those who work with their hands, but still the hard physical worker is often seriously hurt with coffee.

A man from Mead, Wash., says: "Coffee drinking had a different effect on my wife than on me, it ruined her nervous system and put her in very bad condition that way. With me my nerves seemed to be all right but my stomach was disordered and I was suffering from dyspepsia from drinking coffee, so finally we concluded to begin using Postum instead of coffee.

"In a very few days the dizziness and headaches that she had suffered with more or less, disappeared, and her nerves kept getting better and my dyspepsia left, now I can eat anything. I have noticed that in hard work in the harvest field the days when I used coffee I was not near so strong and vigorous as when I used Postum.

"I have had many chances to prove, and have proved that Postum is far and away better for me than coffee, besides I am well now and while I was using coffee I was half sick," Name furnished by Postum Co., Battle Creek, Mich.

The New 1903

REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

enough to become bitter. We watch those cream pails as close as a poultryman watches his incubator. Eternal vigilance on the part of the dairyman is the price of butter!

One of the neighbors told Mrs. Plato last summer that naphtha soap was good to keep the dish cloth sweet and clean. It took us a week to ferrit out the trouble and sweeten up our dairy utensils. We washed, scoured and scrubbed, but that smell in the cream and in the butter makes us shudder yet.

We stop churning when the granules are the size of wheat kernels then add a couple handfuls of salt to make the buttermilk more buoyant, and make the butter rise on top so we can draw off the buttermilk. We next wash with three waters, if the second is clouded much.

I think that adding the salt will save washing with the third water, as we hardly ever use more than two. Then sprinkle the salt over the entire surface of the butter as evenly as possible, and put the cover on and revolve until it is thoroughly mixed. Then we let it stand in the churn 3 or 4 hours, before taking it out into the butter bowl to work. By that time the salt is all dissolved, and a very little working is all that is required to start the brine and remove the freckles.

Cleanliness, temperature, ripeness, first, last, and all the time, will put a man where he will be able to sometime "sit under his own vine and fig tree.

New York. JAMES M. PLATO.

A Successful Cement Silo.

Mr. Harry Smith, the Short-horn breeder, of Huron Co., Ont., gives us his experience with a round cement silo, built last year. The dimensions were 12 ×30 feet, walls about eight or nine inches thick at the bottom and six inches at the top. Portland cement, one to ten parts good gravel, was used, and plenty of stones bedded in. No. 9 wire was laid in also, with every raise of the wooden crib. It was finished about six weeks before being filled, and in about three or four weeks after the walls were constructed they were plastered both inside and out. The walls were made a little stronger at the bottom; great care was taken with the foundation. The ensilage kept perfectly, and there was no sign of give to the walls. If the above conditions are complied with, Mr. Smith has no fear about the permanence and superiority of cement silos. Previously he had a wooden silo for many years. He grows the Leaming corn for ensilage, and cuts it a day or so before filling, to wilt. Never heard of the juice of the ensilage softening the bottom of cement silo walls.—*The Farmers' Advocate.*

Arizona Dairying.

ED. HOARD'S DAIRYMAN:—I have been a reader of your excellent paper for the past six months and would not be without it for anything. Our valley is a great place for dairying.

I am milking twenty-five cows, grade Jerseys and Short-horns. I have made butter for the past four years, but at present am taking my milk to a private creamery, and am quite well satisfied. Our test runs from 4.6 to 5.4. I feed separator milk to calves and hogs.

I see by the DAIRYMAN that a great many people in the east are trying to raise alfalfa. It is the principal hay or grass raised here in Salt River Valley. Of late years we have been raising a great deal of sorghum for cow feed. I have been greatly interested in the silo question. There is not one in this valley. Our cows run on open pasture the year around, but from November to February feed is scarce. Bran is $25 per ton, but very little fed. Alfalfa hay and grass is the main ration.

I would like your opinion on a silo. Many people think it would not pay in a warm country, as we have only hard frosts in winter.

Do you think sorghum would be the best (or as good) to fill a silo with in a warm climate? Would brick answer for building, as it is our cheapest good building material, $6 per thousand. How would it do to put the silo six feet under ground?

I am a young dairyman and much interested in the dairy business and feeding. I have the pleasure of sending you five subscriptions for your valuable paper.

Phoenix, Ar. E. T. VANKIRK.

It is the opinion of the DAIRYMAN that the silo can be made of very great importance to those dairymen who are carrying on the business in the arid portion of the country. What is needed with the cow is a succulent feed. Where abundant pasturage is had the cows get it, and the next best thing is the silo which preserves whatever is put in it, in a succulent condition. We can see no reason why it would not be just the thing for you to put up a silo and preserve therein a part of your alfalfa or sorghum or any other forage which you would otherwise feed dry. If your cows could have a feed once a day of good sweet alfalfa silage it would help keep up the milk flow greatly.

Disposing of Manure.

ED. HOARD'S DAIRYMAN:—I will give my way of disposing of the manure problem: That is to draw direct from the stable and spread on the oat ground, which is fall plowed. By so doing I get a good crop of oats and a fine seeding of clover, which will produce a good crop of (protein) hay, and the following June have a fine crop of green manure to turn under for corn, and any one can raise corn for silage on a good clover sod. This also makes a complete rotation of crops, and leaves the soil better than in the beginning. R. E. B.

Candor, N. Y.

Sanitary Milk.

ED. HOARD'S DAIRYMAN:—The consumers of milk are realizing more fully each succeeding year that they have been consuming an unnecessary amount of filth, and they are getting to rebel more and more against it; why should we not have our milk as clean as any other article of food that comes to our tables? When the producers of milk reach this condition, the consumption of milk will be very much increased, and with this increased consumption causing a larger demand, we shall be able to secure better prices for our product. It will always pay to produce a high quality of milk, especially after one has established a reputation for doing honest work; this must be demonstrated before the public should be expected to have confidence, which is the foundation of permanent success.

THE H. B. GURLER SANITARY MILK PAIL.

Devised by Mr. Gurler and used on his farm at De Kalb, Ill., where about 200 cows are milked daily. No. 1 is the pail complete as ready for milking—the streams strike the cloth at a slant, the cover checking any spatter. No. 2 is the pail as ready for washing. No. 3, the tin ring and part cover that holds cloth in place. No. 4, sheet of fine cheese cloth doubled over a layer of absorbent cotton. No. 5, cap for closing the spout (No. 6) while milking. The cloths are washed, sterilized, and used several times over. The cotton is thrown away at the finish of each milking. One pound of the cotton s sufficient to make fifty strainers.

I once made the statement to an audience of farmers that we consumed more filth in our milk than in any other article of food, and at the close of the session the Dean of an agricultural college said to me, that I might have safely said more than in all other articles of food. Is it any wonder that many delicate stomachs rebel against much of the milk that is put upon the markets of our cities and homes?

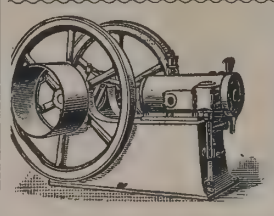
There is not any great expense attached to producing clean milk, as any one that will try can keep the cows clean; they must be kept well bedded with some material; let it be straw, cut corn stalks, sawdust, or shavings; if the cow becomes soiled, she must be cleansed, as this filth, if allowed to accumulate on the cow is sure to reach the milk pail in a greater or less degree. The best way to clean a soiled cow is to have a pail of water and a brush, cloth or sponge, and make a thorough job of it, before it has time to dry; this takes less time than it does to remove it after it has dried and does a more perfect job. The cows should be groomed a half hour before milking, so as to allow the dust, time to settle before milking is commenced. The udders should be washed before milking, even if they are apparently clean; they need it just as much as we need to wash our hands and faces before eating.

The milking should be done with dry hands; it is just as necessary to cleanse our hands before commencing to milk as it is for the cook to cleanse her hands after washing the dishes or other soiled articles before she goes to preparing food for us.

My practice is to have one man cleanse the udders for about 10 milkers and keep just a little in advance of the milkers, as the best results are obtained when this is done, as the manipulation of the udder in the cleansing process stimulates the secretion of milk, and to secure the best results we must work with nature. In case we do not meet nature's first effort, her second effort is not as strong as the first, and as good results are not obtained; if this is persisted in nature can be discouraged completely. I met this condition in my early experience in my certified milk enterprise when I had each milker cleanse the udders of the cows that he was to milk before he commeneed to milk. I soon found that when a cow was put into the certified stable there was a shrinkage in her milk, and the cause was a study for me and it required months for me to solve the problem, but it was at last solved through a hint from a woman (a mother), and I changed the order of cleansing the udders and stopped the shrinkage when the cows were changed into this stable.

For the small dairyman I think it is best for the milker to have a pail of water and sponge and cleanse the udder of each cow just before milking her. In this way he can keep both the udders and his hands clean, and there is equal need of each being clean.

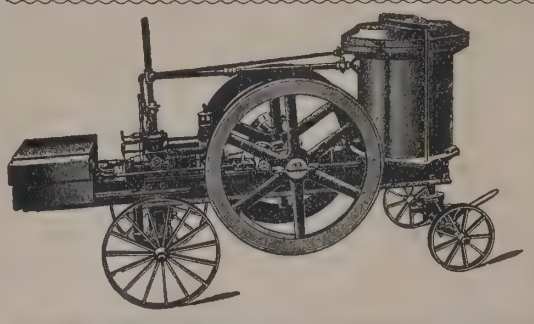
The first few streams from each teat contain but little cream or butter fat, but remove many bacteria that have entered the mouth of the milk duct and should be rejected.



A milk pail arranged with a layer of

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the **"OTTO"** is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper



THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our **Volume Governor** gives uniform speed. Our **Acme Mixer** is the most positive and economical on the market. Our **Hand Starting Lever** starts engine with least effort. All bearings of **Phosphor Bronze.** Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman,"

a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Pleas mention this paper Send for catalogue. **THE TEMPLE PUMP CO.**, ESTABLISHED 1853. Meagher and 15th St., CHICAGO.

absorbent cotton between two layers of cheese cloth is an excellent protection to the milk from the outside surroundings, and is not very expensive as the cheese cloth can be cleansed and used till worn out, though the cotton can be used but for one milking.

Remove the milk from the stable as soon as possible after milking the cow.

The stable should be ventilated. The King system of ventilation is the best that I know of. Have the stable as light as your dwelling house is. The cows need light as much as we do.

Be sure that the water the cows drink is pure, just as pure as the water is that the family use.

Do not allow silage, or other feed with an odor, about the stable at milking time; many more odors get into the milk after it is drawn from the cows than comes through the cows.

Make your wife or some other good housekeeper, Inspector General of this work and pay her a good salary.

De Kalb, Ill. H. B. GURLER.

CONCERNING OUR ADVERTISERS.

Farm lands in some sections of the country which are well settled are selling as high as $100 per acre without many improvements. The land is undoubtedly worth all it sells for, as on that basis, it will pay good interest on the investment. It is just as true, however, that an acre of this $100 land will not produce one cent's worth more crops than an acre of land in Carlton County, Minnesota, that can be bought for from $6 to $8 per acre. For farming purposes, the land here is worth fully as much as in Illinois or Iowa. The one and only reason why land there is selling at from ten to twenty times as much as our land is, is that it is more thickly settled. The day is near at hand when the country around Duluth and the head of Lake Superior will be as thickly settled as Iowa. Then our land will sell for $100 per acre and more. If the young farmers of the country only knew the actual facts concerning this part of Minnesota they would be tumbling over each other to get here to buy land. Many good practical farmers, both young and old, have already bought, and most of them have settled, or will settle in the spring, on this land, but there is room for many more. Prices, however, are steadily advancing and those who buy now will be the ones who will profit the most. For particulars address Guaranty Farm Land Co., Duluth, Minnesota, and mention HOARD'S DAIRYMAN.

BONA FIDE OFFER.

We wish to say that the offer of the Bluine Mfg. Co., Box 91, Concord Junction, Mass., to give a stem-wind, nickle plated watch, chain and charm to any person, man, woman or child, who sells nineteen packages of Bluine at 10 cents each and remits them the money thus received, is a genuine and bona fide offer. Their large premium list and the Bluine for you to sell are sent free on request to all who write.

Don't overlook the ad of the Polk County Land Co., Crookston, Minn. This firm have for sale some choice Red River Valley lands, and in their advertisement mention some good propositions of improved farms. It costs but a postal card to receive full information about these lands. Drop a card today and mention HOARD'S DAIRYMAN.

When making up the spring seed order, and particularly for potato planting, don't overlook that sterling seedsman, L. L. Olds, located in the great potato state of Wisconsin. Mr. Olds has his own ideas about seeds and planting which his customers invariably find it a great thing to put into practice. These ideas are drawn from a close study of varieties as adapted to different climates, and from keeping in close touch with the results produced by his customers. Mr. Olds never allows his business to get so big that his master hand is not present in every department, from the choice of the varieties to recommend, their description in the catalogue, etc., down to the details of filling and shipping of orders. That means much to the planter, for if there be error, negligence, substitution or indifference in filling your order, the evil is not discovered until it is too late to remedy. It is worth something to know in advance that you are planting just what you had counted upon, and that it is the freshest and purest to be had. A postal to Mr. Olds at Clinton, Wis., will bring you his catalogue.

DOMESTIC WATER SUPPLY.

There are few things so vitally important to the dweller in the country as a supply of water. This problem has been met in the past by various expedients, some of which have answered for the time, but have eventually had to be abandoned. The great importance of an ample and positively reliable water supply cannot be overestimated. It has been demonstrated too often to require argument that all zymotic diseases are due to an insufficient supply of water or a supply of water which was not fresh or pure. Windmills have been used to a great extent during the past on account of the great cheapness in first cost, but first cost should not enter into so important a question as this, as it is a question of placing a small amount of money against the lives or health of the people using the water. The Rider-Ericsson Hot Air Pumps offer the most reliable method for procuring water for stock or household use. The address of the Rider-Ericsson Engine Co. is 35 Warren street, New York; 239 and 241 Franklin street, Boston; 40 Dearborn street, Chicago; 40 North Seventh street, Philadelphia; 692 Craig street, Montreal, P. Q.; and a letter to any of these would bring a catalogue with any special information desired by any of our readers.

FKED GRINDER ENDORSED.

From the inquiries we receive we conclude it is a mistake to assume that all feeders have learned practically the great value to be derived from grinding feed. We are frequently asked to advise in regard to the benefits and to recommend a mill well suited to the purpose. As to the benefits, so much has appeared in this and other papers from time to time regarding the saving of feed, the rapid fattening of stock and all other phases of the subject, and the custom is so universally endorsed by experiment stations and adopted by experienced feeders, as to require no special comment here. As to the mill to use, we are constrained to say that no reader can go wrong who turns to our advertising columns and proceeds to interest himself in the Quaker City Grinding Mills manufactured by A. W. Straub & Co., of Philadelphia. We believe their continuance in high favor for a period of thirty years among feeders who would be expected to know what is best adapted to their uses, warrants us in giving them unreserved commendation. Of course, in the thirty years they have been improved. It is their mill of today of which we speak. A feature to be noted is the double hopper which suggests the ingenious means by which they crush and grind ear corn and grind and mix with it in desired proportions the smaller grains, all in one operation. Either may be used by itself if desired, and the mill is noted for the excellent quality of corn or oat meal for household use it turns out. Fitted with ball bearings it is a remarkably easy runner. We cannot here enlarge upon its special good qualities. The wise thing to do is to send to the manufacturers for their catalogue and get full information at first hand. It will be mailed free to any one writing for it and mentioning this paper.

AN IMPORTANT SALE OF JERSEY CATTLE.

We wish to call special attention to the advertisement of Messrs. Case & Walker, of Rushville, Ind., appearing on another page of this paper. This firm, breeders and importers of Jersey cattle, will sell at public auction on Tuesday and Wednesday, April 28 and 29, the entire herd of Jerseys on their Jersey Isle Stock Farm, consisting of over one hundred head. Every animal to be sold was born on the Island of Jersey, except the young stock dropped last year on the farm by cows imported during 1900 and 1901. There has never been on this farm a cow of any description except imported Jerseys and those out of imported parents; and since the original stock has all been subjected to the tuberculin test, and there has been no chance for disease to enter the herd from outside sources, the cattle are in perfect health. They have had the run of 160 acres of natural bluegrass pasture, the very best of feed and attention, and are in condition to do their best work.

A SIGNIFICANT COMMENT.

A Missouri subscriber writes as follows:

"I wonder some times if you realize the splendid education the DAIRYMAN is giving to those who read it steadily, right along, year after year; I started four years ago. I had had but little education, and I could not understand the scientific terms that writers and speakers used. So you see I was barred out from knowing what I ought to know. The DAIRYMAN took right hold of me and made me feel that I must arouse myself. I bought a dictionary and when I struck a word that I did not understand, I dug it out. The result is that I have gained immensely in my understanding. I am a good deal more of a man and a farmer than I was. A lot of my neighbors are just where they were, and they will die there. But their sons are beginning to get a little hungry. They will feel ashamed not to know what belongs to their dairy business; what every good farmer ought to know. Keep right on stirring us up. Never mind the kickers and the men who have more sensitiveness than sense. Don't cease firing. J. V. THOMPSON.
Missouri.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Will Fumes from a Smelter Affect Cattle?

Do you believe the smoke and fumes of the copper smelters, which we have here, would be liable to affect the lungs of cows to such an extent that the tuberculin test would react from this cause?
Butte, Mont.

ANSWER.

We are of the firm opinion that the fumes or smoke above mentioned cannot affect in any way to make them react to the tuberculin test, but would suggest that the animals reacting would be isolated for 60 days and kept away from the fumes and smoke, and then be re-tested, which will be a positive proof.

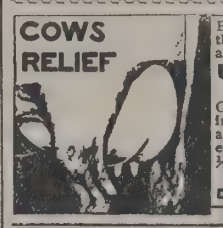
To Dehorn Cattle.

Will you please inform me which is preferable, to dehorn cattle by sawing, or using a clipper?
Kelso, Ore. B. N.

ANSWER.

Though both methods are applied with good results, the writer prefers the saw, believing it to make a smoother cut without cracking the horn.

Horse Owners! Use



GOMBAULT'S
Caustic Balsam

SPAVIN CURE

POSITIVELY AND PERMANENTLY CURES bone and bog spavin, ringbone (except low ringbone), curb, thoroughpin, splint, capped hock, shoe boil, weak and sprained tendons and all lameness.

——FOOL TALK——

About 35 years ago a young mechanic called on old Commodore Vanderbilt, then head of the New York Central Railroad, in an effort to secure a trial on a New York Central train of a new device for stopping trains by compressed air.

"Air!" the Commodore is said to have exclaimed. "Air! Stop a train with air! I've not time to listen to such 'fool talk,' young man," and he didn't. Neither would anyone else for many a long day.

George Westinghouse, for he was the man of the "fool talk," believed in himself and the utility of his invention. He kept right on in spite of Commodore Vanderbilt and the others till he forced recognition. Would a man trust himself aboard a passenger train today if he knew that train was not fully equipped with Westinghouse's invention—the air brake? It is said that Vanderbilt's road had some difficulty in getting it when finally it was wanted.

Many a man says "fool talk" when he reads the claims made for "Save-the-Horse" spavin cure, but the dawn of enlightenment is as certain as the rising of the sun, and the man who says "fool-talk" after reading the facts so plain and convincing as given by us, reaffirmed by the letters published in these columns every week, and in our booklet, is repeating Commodore Vanderbilt's mistake. No man need be in doubt as to what "Save-the-Horse" spavin cure can, and cannot, do. If you have a case different from what are described in booklets and advertisements, send us full particulars as to the age, location, cause of the lameness or swelling, the horse's action, previous treatment, and also the veterinarian's diagnosis, if you know he is competent, and we will tell you frankly as to the possibilities of our remedy. Write for booklet and copy of guarantee and any information desired.

Heed this:—
Work horse continuously if desired.
"Save-the-Horse" cures without scar, blemish or loss of hair.
Contains no arsenic, corrosive sublimate or other form of mercury or any ingredient that can injure the horse. $5.00 PER BOTTLE.
Written guarantee with every bottle.
There is no condition or arrangement we can make more binding to protect you than our guarantee.
NEED OF SECOND BOTTLE IS ALMOST IMPROBABLE EXCEPT IN RAREST OF CASES.
$5.00 at all druggists' and dealers', or express prepaid.
TROY CHEMICAL CO., Troy, N. Y., manufacturers.
Also Veterinary Fixine, for grease heel, scratches, speed cracks, cases where ulcerations extend, with transverse cracks which open at every step and often bleed, no matter how complex, aggravated, deep seated or chronic; if treated according to directions, as given on circular with every box, positively cured.
KEEPS HOOFS HEALTHY, SOFT AND IN PERFECT FORM.
Heals collar and saddle galls, hopple chafes, abcessess and all skin diseases.
Two oz., 25c.; 8 oz., 50c.; 5 lb., $4; all druggists and dealers, or sent prepaid.

ANTITOXIN
For the Cure and Prevention of Milk Fever.
No quackish humbug but a scientific fact. Works on same principle as antitoxin injection in man for diphtheria, destroying poison in system. Out of 110 cases treated in Portland, Mich., 109 recovered last year. Easily administered with a syringe. Inexpensive. Write for particulars to DR. W. E. A. WYMAN, V. S., Prospect, Ohio

BLACKLEGOIDS
BEST PREVENTIVE OF BLACKLEG.

Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each **Blacklegoid** (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. **Blacklegoids** are sold by druggists; *ask for them.*
Our newly printed eight-page folder on the "Cause and Nature of Blackleg" is of interest to stockmen. Write for it; it is free.

BARREN COWS CURED.
Our treatment has been used successfully since 1878 in every state in America, Canada and Great Britian. Write for Pamphlet.
MOORE BROS., Veterinary Surgeons, Albany, N. Y.

CURE "THE" COW
NO CURE, NO PAY

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of the remedy—$2.00 per quart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address

DR. EATON J. GROSS,
153 Congress St., Troy, N. Y.

Barrenness in Cows.

ED. HOARD'S DAIRYMAN:—I have received a sample copy of HOARD'S DAIRYMAN in which I find a question of J. C. N., of Tacoma, Wash., relating to barrenness. Your answer is "See barrenness, this issue." That especially interested me, as I have a fine-grade Jersey heifer now past two years old, which I have not been able to get with calf. I have looked the issue through very thoroughly but do not find any article on "barrenness."

I would be glad to know of a remedy that would be successful and safe in the hands of a man of ordinary intelligence.

There are no veterinary doctors in this vicinity. M. M. E.

Sandy Creek, N. Y.

This is a feature of dairying that is exceedingly bothersome at times. Barrenness seems to be an accompaniment as a side feature of abortion. In cases where abortion prevails or has prevailed to any extent in a herd, more or less of the cows are hard to get with calf. The other day, while visiting the celebrated Jersey herd of Frank W. Hart, of Cleveland, Ohio, we found that the favorite remedy there was hemp seed fed to the barren cows at the rate of a half to a full pint a day. Mr. Hart says it is excellent. Several remedies are advertised in the DAIRYMAN; all are good, but they fail at times. We can only say: Do not get discouraged until you have to.

The East Tennessee Farmers' Convention.

The 28th annual meeting of the East Tennessee Farmers' Convention and Farmers' Institute will be held in Knoxville on May 21, 22 and 23. The railroads have granted a single fare for this meeting over a wide territory, embracing not only East and Middle Tennesse, but reaching out into the adjoining states. Tickets to this meeting will be good going May 20, 21 and 22 with a final limit to of May 24 for returning. Last year there were 1,500 tickets sold to the meeting and there is every reason to expect a much larger attendance this year.

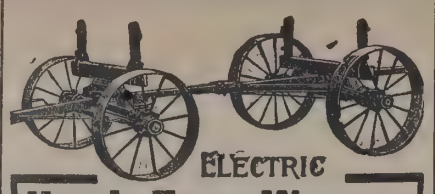
An unusually strong program is being prepared. The very best agricultural experts of the United States, and of the South in particular, will occupy places on the program. The local interests have not been overlooked and the practical discussions of every topic by the leading farmers of East Tennessee will be a very interesting feature of the program which will be issued about the middle of April.

Every farmer should make his plans now to attend this meeting. It is the greatest gathering of its kind held anywhere in the south and for that matter in the United States. One can not come in contact with such a large body of progressive and enthusiastic citizens without being materially benefited thereby. Paste the dates in your hat so you will not forget them and tell your neighbors and friends about the convention.

Any person desiring further information about the meeting should apply to Prof. Andrew M. Soule, Secretary, Knoxville, Tenn., who will cheerfully answer all letters of inquiry.

Renovated Butter.

Rules and Regulations Prescribed in Regard to "Renovated Butter," in Accordance With the Act of Congress Approved May 9, 1902.



It is hereby ordered, That Rule No. 18 of the Rules and Regulations prescribed in regard to Renovated Butter, published from this office under date of November 1, 1902, be revised and amended, with the concurrent approval of the Secretary of the Treasury, by the insertion of a new sentence, as follows:

But manufacturers may pack prints, bricks, or rolls of one-half pound each in weight, under the conditions and requirements prescribed by this rule, and provided that such one-half pound prints shall be of shape and size to admit of the same marking and branding as is required in the case of prints weighing one pound or more.

The rule entire, as amended, will be as follows:

18. Manufacturers will be permitted to pack prints, bricks, or rolls of renovated butter, not less than one pound each in weight; but each print, brick, or roll must have stamped thereon the words "Renovated Butter," in two lines, the letters to be depressed, of gothic style, not less than three-eigths inch square and sunken not less than one-eighth inch. But manufacturers may pack prints, bricks, or rolls of one-half pound each in weight, under the conditions and requirements prescribed by this rule, and provided that such one-half pound prints shall be of shape and size to admit of the same marking and branding as is required in the case of prints weighing one pound or more. The contents of any package less than 10 pounds will be considered as a brick or roll.

Washington, D. C. JAMES WILSON, Secretary.

ELECTRIC

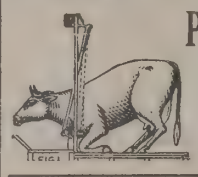
Handy Farm Wagons

make the work easier for both the man and team. The tires being wide they do not cut into the ground; the labor of loading is reduced many times, because of the short lift. They are equipped with our famous **Electric Steel Wheels**, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. Guaranteed to carry 4000 lbs. Why not get started right by putting in one of these wagons. We make our steel wheels to fit any wagon. Write for the catalog. It is free.

ELECTRIC WHEEL CO., BOX 130, QUINCY, ILL.

Wilder's Stanchion

—being an improvement over Smith's. Lightest, strongest, quickest, safest swing stanchion made. Has steel latch and automatic lock. Becomes stationary when open. Animal cannot turn it in backing out. Made of best seasoned hard wood. Pins for fastening with every stanchion. Send for testimonials. Box 811



J. K. WILDER & SONS, Mearee, Mich.

$28 FREE

FOR A TESTIMONIAL

You can have ripe tomatoes June 15th, ripe melons July 1st, new potatoes and cucumbers May 15th. All other vegetables or flowers as early by using Gold Mine Hot bed. It protects all kinds of plants from frost, cold raw winds and storms. Keeps off the bugs, insects, cutworms. Stimulates plant life in such a manner as to make them grow three times as fast. Indorsed and recommended by every agricultural paper in the United States, and by every farmer that has used them. There is not a Tool or implement that the farmer buys that will bring htm in as large returns each year as this. It will pay for itself forty times a year, with proper usage.

We have reduced the price from $1.50 per dozen to 85 cents, for immediate acceptance. Sold on the same guarantee to give satisfaction as plows, binders, and mowers are sold, or money refunded. When you find they are better than you expected them kindly send us a testimonial. Next year you will want more of them; we will reciprocate your kindness with a present.

We will give 200 Gold Mine Hot Beds to the person sending in the best report; 100 for second best; 50 for third; value $28, and pay all charges to destination. Premiums paid in November. Points considered—Earliness yield, amount of money made, with one dozen. Please do not delay your orders.

60,000 ACRES OF IRRIGATED LAND IN THE

HEART OF CALIFORNIA

Alfalfa a specialty. Creameries on the Estate. Ample Railroad Facilities. Land Sold on Easy Terms in Small or Large Lots.

WRITE THE MANAGERS

404 GREAT NORTHERN BUILDING.....CHICAGO.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

200,000 ACRES TO SELECT FROM

We own 40,000 acres in Red River Valley, in Marshall and Kittson Co's, Minn. and in Walsh and Grand Forks in N. D. 15,000 acres in LaMoure, N.D. Fine stock ranches in Logan and Mercer Co's, N.D. 50,000 acres of Timber land in Aitkin Co. Minn., and Washburn Co., Wis. Also 15,000 acres in Southern Minn. in Lyon and Redwood Co's, near Marshall.

WRITE FOR OUR MAPS. We can give you a farm from $5.00 to $50.00.

Official Records of Holstein-Friesian Cows, from Jan. 15 to Feb. 10, 1903.

Records of 60 cows have been approved during this period, of which 11 have records for thirty days, two for fourteen days and one a record for thirty-five days. All have seven day records, of which the averages are as follows:

Seventeen full-age cows—Milk 433.3 lbs., butter fat 14.808 lbs,; eleven four-year-olds, milk 399.1 lbs., butter fat 13.697 lbs.; thirteen three-year-olds, milk 340.1 lbs., butter fat 12.007 lbs.; nineteen two-year-olds, milk 283.5 lbs., butter fat 9.491 lbs.

The cows making 30 day records were as follows:

Paul DeKol Aaggie Queen 46899—milk 2,345.3 lbs., butter fat 75.939 lbs. Best seven days, milk 570.5 lbs., butter fat 18.296 lbs.

Shadeland Zora 2d 36219—Milk 2,160.3 lbs., butter fat 69.333 lbs. Best seven days, milk 501.9 lbs., butter fat 16.998 lbs.

DeKol Netherland Frazier 41292—Milk 1,734.8 lbs., butter fat 68.190 lbs. Best seven days, milk 422.4 lbs., butter fat 16.687 lbs. Owner Averill & Gregory, Syracuse, N. Y.

Pietertje DeHaan 40973—Milk 2,029.9 lbs., butter fat 67.677 lbs. Best seven days, milk 515 lbs., butter fat 16.404 lbs.

Altoana Pietertje A. 54656—Milk 1,967.8 lbs., butter fat 63.881 lbs. Best seven days, milk 472.3 lbs., butter fat 15.878 lbs. Owner, Averill & Gregory. Syracuse, N. Y.

Orpha Keyes 36223—Milk 1,576 lbs., butter fat 58.213 lbs. Best seven day, milk 391 9 lbs.; butter fat 14.556 lbs. Owner, Averill & Gregory, Syracuse, N. Y.

Aaggie 3d's Wayne Pauline 2d 47450—Milk 1,736.3 lbs., butter fat 57.162 lbs. Best seven days, milk 422.3 lbs., butter fat 13.902 lbs. Owner, Averill & Gregory, Syracuse, N Y.

Clothilde Artis Belle 2d 39861—Milk 1,642.5 lbs., butter fat 56.529 lbs. Best seven days, milk 414.4 lbs., butter fat 14.065 lbs. Owner, Averill & Gregory, Syracuse, N. Y.

Tina Pauline 34814—Milk 1,517.3 lbs., butter fat 56.230 lbs. Best seven days, milk 366.2 lbs., butter fat 15,050 lbs. Owner, Averill & Gregory, Syracuse, N. Y.

Helena Pietertje Burke DeKol 2d 56071—2 years; milk 1,758.8 lbs., butter fat 47 920 lbs. Best seven days, milk 418.9 lbs., butter fat 11.564 lbs.

Eva Blanco 56030—2 years; milk 1,461.8 lbs., butter fat 44.619 lbs. Best seven days, milk 338.7 lbs., butter fat 11.463 lbs.

The cows making the fourteen day records were as follows:

Jessie Fobes 2d's Maud 2d 44123—Milk 907.8 lbs., butter fat 31.415 lbs. Best seven days, milk 460.5 lbs., butter fat 16.903 lbs. Owner, W. H. Jones, Watertown, Wis.

Lily Castine 52576—3 years; milk 774 4 lbs., butter fat 27.356 lbs. Best seven days, milk 408.8 lbs., butter fat 13.968 lbs.

The seven day records, not above given, were as follows:

DeKol Koningen Pauline 44012—Milk 457.4 lbs.. butter fat 16.108 lbs.

Bertie Blanche 49663—Milk 442.1 lbs., butter fat 16.069 lbs. Owner, Frank B. Fargo, Lake Mills, Wis.

Nellie Hartog 35163—Milk 384.5 lbs., butter fat, 14 435 lbs. Owner, Averill & Gregory, Syracuse, N. Y.

Kittie Rouble 35854—Milk 424.5 lbs., butter fat 14.157 lbs. Owner, Averill & Gregory, Syracuse, N. Y.

Helena Pietertje Burke DeKol 42113—Milk 522.4 lbs. butter fat 13.759 lbs.

Rose Aaggie Liddisdale 1413 W.—Milk 388.3 lbs., butter fat 12.999 lbs,

Lady Alice —— —Milk 348.8 lbs., butter fat 12.662 lbs.

Susie Lamb DeKol 46181—Milk 495.2 lbs., butter fat, 12.577 lbs.

Corona Siempje 55503—Milk 358.3 lbs.. butter fat 12.421 lbs. Owner, Averill & Gregory, Syracuse, N. Y.

Mulvie 2d's Pauline DeKol 45122—Milk 425.2 lbs., butter fat 15.125 lbs.

Pauline DeKol Lilith 47419—Milk 425 lbs., butter fat 14.986 lbs.

Castine Witkop 47578—Milk 509 lbs., butter fat 15.636 lbs.

Mercedes Kiatta Antje 61553—Milk 364.4 lbs., butter fat 13.812 lbs.

Does it Pay to Make Second Grade Butter?

Ed. Hoard's Dairyman:—It has been stated within the past few months in many parts of Kansas that it does not pay the Kansas dairyman to spend time and labor to make first grade cream and butter. I wish to say most emphatically in the beginning of this article that under no consideration does it pay to make and market a second grade of butter, even if there is from one to three cents per pound saved in the hauling of cream and the making of butter. My personal experience in this matter of quality in butter has been my best teacher, and a short recital of these experiences I hope will help to save the Kansas dairyman from the mistake of thinking that it is well enough to be satisfied with second grade cream.

I started in the creamery business in Kansas nine years ago, and I have seen the time when the word, "Kansas" before the word "butter" made the butter absolutely unsalable. When I started in the creamery business in Beloit, Kansas, in the fall of 1893, I wrote a letter to a prominent commission firm in New York City requesting them to handle my acount in New York City on consignments

You all know what it means to consign goods. The consignee sells the goods at what ever he can get, deducts the freight, shrinkage, drayage and commission, and then sends the consignor check for the balance. You would hardly believe it at this time and day, but in answer to my letter requesting this prominent firm to handle my account, they wrote that Kansas butter was not desirable and that they did care to handle it under any conditions. That was the time when there was no reputation established on Kansas butter, when mostly second grade goods had been manufactured in this state, when most of the butter throughout the east, south and west, was sold under the name of Elgin creamery.

Farmers of Kansas, perhaps, can hardly realize the work that has been done by Kansas creameries in the past eight years to build up a market and gain a reputation for Kansas creamery butter, but we have it today so that Kansas butter is taken under its own name and is equal to the best butter made in this country.

In late years, the hand separator is coming into universal use and by reason of this, many farmers do not haul their cream as often as they should. There is but one criterion of fine quality of cream; it must be sweet and fresh so that it can be pasteurized and cooled. It

Spring Medicine

There is no other season when good medicine is so much needed as in the Spring.

The blood is impure, weak and impoverished—a condition indicated by pimples and other eruptions on the face and body, by deficient vitality, loss of appetite, lack of strength, and want of animation.

Hood's Sarsaparilla and Pills

Make the blood pure, vigorous and rich, create appetite, give vitality, strength and animation, and cure all eruptions. Have the whole family begin to take them today.

Hood's Sarsaparilla promises to cure and keeps the promise.

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

RIDER or ERICSSON HOT AIR PUMPS

Are used you can have water every day in the year, and your cook or stable boy is the only engineer needed. 25,000 in daily use. Catalogue "B 5" on application to nearest store.

ILLUSTRATION.

A Kansas Pioneer—A Binder That has cut Upwards of 100 Acres for Many Years Past.

The above is from a photograph of an old Plano binder owned by E. F. Siscoe, Linwood, Kansas. This machine for seventeen or eighteen years past has cut a crop averaging from ninety to one hundred and forty acres each season. The expense for repairs during all that time was less than two dollars. This is the kind of testimonial that talks, and should certainly be very gratifying to the manufacturers of Plano machines. A concern which turns out a harvester so honestly built that it can hold its own against the Kansas winds and "rough it" through the early days of hard times on a western prairie, can certainly be trusted to produce money-saving implements for ordinary farm use. In fact, the superb binder, as well as other machines sent out by Plano Division, International Harvester Company of America, is a striking improvement over the old-time harvester shown above, but will be found to contain the same elements of durability and correct mechanical construction which have kept the old-timer doing business all these years. A handsome catalogue of Plano Binders, Headers, Reapers, Mowers, Rakes, Corn Binders, Huskers and Shredders, and Sickle Grinders can be had by addressing the company at Chicago or apply to any Plano branch house.

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.

CANTON, OHIO.

should be hauled every day in the summer time and every other day in the winter time to the skimming or cream receiving station. There is butter made in Kansas today from hand separator cream which is sold under the reputation built up by Kansas butter during the last eight years; but this cannot be done forever and it must be the policy of every Kansas creamery patron to take a broad view of this subject, a patriotic view, and see that he brings to the skimming or cream receiving station, a first quality of sweet fresh cream.

Butter fat in hand separator cream is worth to-day 25½ cents, delivered to skimming and cream receiving stations. When the consumer buys a pound of butter and pays for same 29 to30 cents, what induces him to pay such a high price if it is not the pure flavor, the pure aroma and pure taste found in first-class creamery butter? If the customer wanted to buy a pound of grease, he could buy a pound of lard or a pound of oleomargarine or a pound of dairy butter, the wholesale price of which to-day is only 12 to 13 cents per pound. I maintain that when the consumer pays from 29 to 30 cents for first-class creamery butter, he pays 10 or 15 cents for a pound of fat and the balance of 15 to 20 cents he pays for the pure taste, pure aroma and the pure flavor in first-class creamery butter. It is the purity of this butter that increased the demand and consumption of same.

When any one argues that it pays the Kansas farmer to bring his cream once or twice weekly, to take a little less for his butter fat by reason of the cream not being first-class; when any one argues that this is a good proposition for the farmer, I say that it is the most dangerous proposition that has ever come up before the Kansas farmer engaged in dairying. There is an active demand for the very best kind of creamery butter only. This demand is steadily growing; the demand and consumption of same is increasing. This is what makes the market high, this is what gives the farmer more for his butter fat to-day than he has received for many years. If the market were flooded with second grade cream it would be lower, and when the question is argued that the farmers of Kansas can afford to bring their cream but once weekly, take one to two cents less for their butter fat and save hauling expenses, I say it does not pay, taking into consideration the present, next year and the year after.

To get a top price, to stimulate the demand and the consumption, we must make the best of everything, and that is the only permanent basis to work on. The finest creamery butter to-day is worth 28 cents per pound; dairy butter to-day is worth 12 cents per pound. This, in itself, is the best object lesson we need. It pays to make the best, the very best only, even if it should cost the farmer one or two cents per pound butter fat more to have it hauled. He should have it hauled every day in summer, every other day in the winter; this is the only pure, permanent basis on which creameries in Kansas and other places can operate and make money for themselves and for their patrons.

Treatment of Abortion.

ED. HOARD'S DAIRYMAN:—As I look over the columns of the DAIRYMAN I find many inquiries for prevention and cure of abortion. It is not without a feeling of sympathy—I thought perhaps I might in a poor way, tell what helped me out.

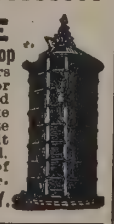
Having been told I must tear out and burn my stable floors, plow up my pastures, stump lot and all, and many other things unnecessary—after reading and doing some hard thinking I tried the following: I procured a bottle of bichloride of mercury tablets, one hundred in a bottle, costing 25 cents, and four feet of half-inch, three-ply rubber hose, put one tablet in from eight to ten quarts of water from 100 to 105 degrees. This is sufficient for two cows. For cows with calf, round the end of hose, slowly work the hose in the vagina from 12 to 15 inches past the entrance to the bladder, slip the other end on a hand force pump, and force half the water in.

After the cows have been lying down, you will find a discharge, either on the tail or in the gutter. If it is stringy, bluish white, you need not fear. If it is thick, milky white or mixed with dark, murky pus, you may be sure there will be an abortion. Use one tablet in six or seven quarts of water on these cows, every other day, for four or five days, and once every three weeks, until within three weeks of the time the cow is due to drop her calf. I have used this treatment every day for ten days with good results.

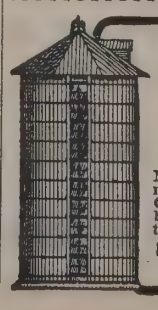
Where the cords had slackened, and milk in the udder, should these cows abort, remove the placenta as soon as possible, if it can be done without injury to the cows, as the contraction is very rapid in case of abortion. Use the same solution every other day until all discharges have ceased. If the same bull is used on these cows again it will be necessary to go over.

When the cows are again with calf, use lime or ashes in the gutters and over the discharges. A slight swelling or smoothness of the vulva is indication of coming abortion, feed liberal as advised in the DAIRYMAN. More might be said on the subject, perhaps this will over tax the patience of the Editor.

C. R.



Clinton, N. Y.



OUR readers have often been instructed by what Prof. Sanborn, of New Hampshire, has written in HOARD'S DAIRYMAN. The professor has been known for years as one of the leading investigators and teachers of Agriculture in the United States, but he is too modest to say what he is doing. A New Hampshire paper states that he is farming over 1,000 acres of land and managing very successfully a herd of 175 cows.

COMMON SENSE Calf Feeder
awarded Gold Medal at Pan-American Exposition. The only Feeder adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.
Most Durable, Simple, Economical, Scientific and Practical.
Do not be deceived by imitators. Shams are never imitated. More Common Sense Feeders are in use than all others combined. Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.
Extra gain on one calf pays for two feeders.
Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.
Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.
The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of Your Feeder, I believe to be the correct one. C. PLUMB, Director.
Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.
Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. Be Sure and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

This is the
Pioneer Parchment Paper Man.

It is an enlarged reproduction from the figure in the center of our trade mark. We make it this size so that you may take in all the lines and remember the figure. It stands for the highest quality of parchment paper on earth. When you buy anything of this kind you should insist that the "Parchment Paper Man" trade mark is on it. It is a positive guaranty of quality.

Pioneer Brand
Parchment Paper

is more largely used than all others by the dairymen and creamerymen of the country. This is so because after trial they have found it the best. They have found that it protects their butter and hence their reputation. It keeps out entirely all destructive germs and vile taints and odors and preserves the sweetness and flavor perfectly. We print your name, cut of dairy or creamery, trade mark or private brand upon each sheet. Send for sample sheets of the paper and booklets. **Be sure to ask specially for our booklet, "Better Butter."** We mail all these free. Address

Impurities in Alfalfa and Clover Seeds. Alfalfa Dodders a Menace.

[Press Bulletin.]

By A. D. Selby.

Recently a number of samples of red, alsike and crimson clover and of alfalfa seeds have been examined at the Ohio Experiment Station under the direction of the botanist. These show no evidence of serious lack in respect to vitality, but in respect to weed seed impurities the outcome is a warning against employing seeds that have not been recleaned. Recleaned seeds show so much greater freedom from impurities than the seed as it comes from the clover huller, that recleaning becomes a necessity. To put it another way; the seed is free from impurities in proportion to the number of times recleaned. The farmer cannot afford to seed his land to plantains, to new weeds of any kind nor to infest his clover field with dodder.

During the season of 1902 attention was frequently called to something wrong in newly seeded alfalfa fields and incidentally to the fact that much more alfalfa is being sown each season. Patches in new alfalfa fields were often found where dodder had killed the stand over a circular area.

ALFALFA DODDERS IN THE SEED.

The alfalfa seed comes very largely from the irrigated region, especially from Colorado and Utah. Two kinds of dodder seeds are common in this western alfalfa seed: the kind more common, has seeds that will pass through a 20 mesh sieve, while the other is more nearly the size of the alfalfa seed. More than one half the samples of alfalfa seeds examined in Nevada two or three years ago contained the small seeded dodder, while more than one-fourth of them contained the larger dodder seed. Of fifteen samples of alfalfa seed, recently examined in Ohio, two contained seeds of the smaller seeded and two of the larger seeded dodder, but the number of seeds found of the small seeded dodder was many times that of the larger seeded.

The many cases of dodder-killed patches in alfalfa fields last season and these facts just stated show that no one should sow alfalfa seed without recleaning through a sieve of 20 meshes to the inch before sowing.

It is hoped this warning will reduce the number of dodder infested alfalfa fields the present season.

Fertilizer for Alfalfa.

Ed. Hoard's Dairyman:—Will you please advise me the best mixture of commercial fertilizer to top dress alfalfa. Something that will give it a good start in the spring. I sowed the seed last April and have a good set—thought top dressing would help it. S. K. H.
Carroll Co., Md.

A good fertilizer for alfalfa would be as follows:

Nitrate of soda	50 lbs.
Acid Phosphate	350 lbs.
Muriate of Potash	100 lbs.
Total	500 lbs.

Use the above quantity per acre.

If the alfalfa is well established, a top dressing of stable manure, well rotted and free from any large amount of straw can be used with great advantage. If stable manure is used on young alfalfa there is liability of weeds killing out the young plant.

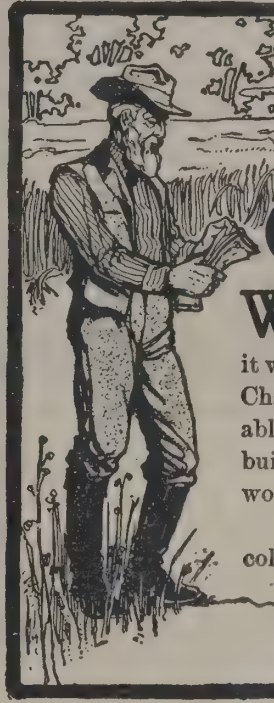
Ensilage Milk.

Ed. Hoard's Dairyman:—To be at its best must be cared for in barn building. The cry against ensilage milk and any badness of ensilage milk, if bad it be, comes from bad usage of the ensilage.

The human being eats canned corn pudding with relish and benefit, but it is not frozen stuff or exposed to the air long before it is made up; and ensilage proper may be as beneficial to cattle, as are our canned corn, or canned peaches, or held apples on our own dinner and supper tables to ourselves.

These wart silos, tacked on to the outside of our barns, and delivering frozen ensilage, the top of which has been exposed 24 hours, are N. G. They never ought to be built, and some of us have got to tear them off and start over again with a pair of twin silos in the middle of our barns, which deliver ensilage free from frost, and being fed out singly expose the least possible surface between feedings. "He that hath ears to hear let him hear." "An Old Roadmaster."
Rockdale, N. Y.

ARMOUR'S BLOOD MEAL Cures Scours in Calves.



First proved by the Kansas Agricultural Experiment Station, and since corroborated by thousands of leading stockmen who have used it without a single failure. Equally effective for the diarrhea of all animals.

PREVENTS weak bones, paralysis of the hind legs and "thumps" in pigs; "big head" of foals; "rickets" of all young animals; abortion due to incomplete nutrition, and a host of other troubles.

A Potent Food for Work Horses, Dairy Cows, Poultry.

Write us for booklet giving valuable information about **Blood Meal** and our other feeding products. Consult us free of charge regarding stock diseases.

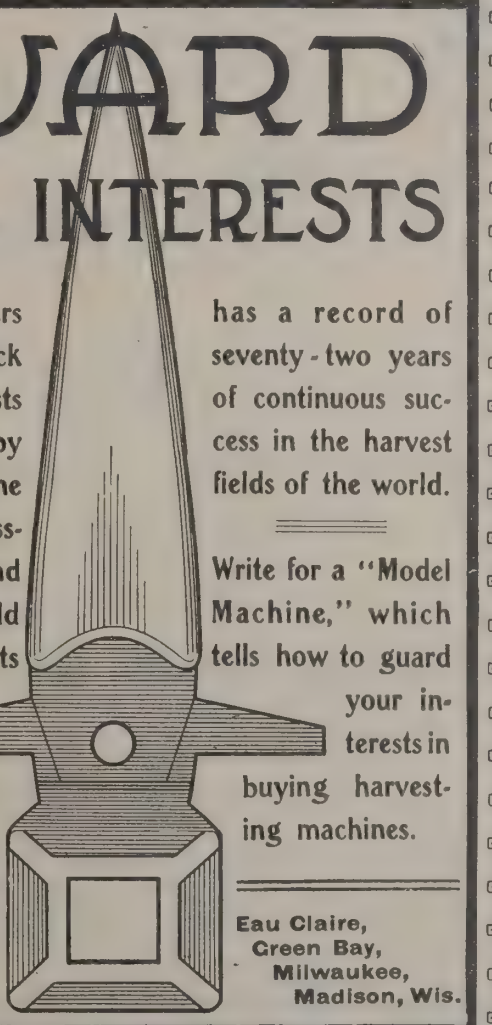
Count the Cost

WHEN you buy a harvester, count the cost of keeping it in repair, and the length of time it will last, as well as the price you pay at first. Champion Binders, Mowers and Rakes are durable because they are correctly designed and well built. This also is the reason for the excellent work they do.

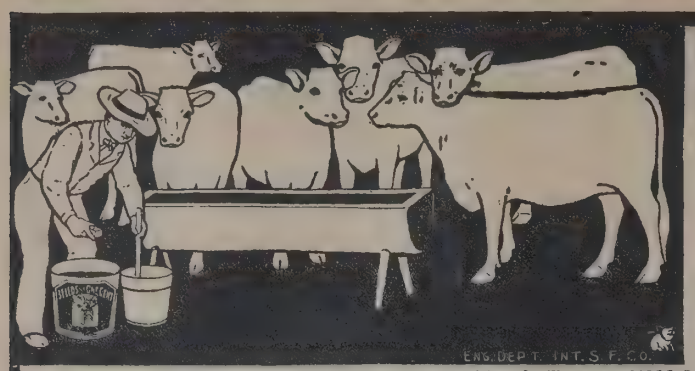
A catalog describing them and a handsome colored calendar may be had for the asking.

CHAMPION DIVISION,
INTERNATIONAL HARVESTER CO. OF AMERICA
CHICAGO.



GUARD YOUR INTERESTS

The manufacturers of the McCormick guard the interests of agriculturists by building a machine that works successfully in the field, and the farmer should guard his interests by purchasing the McCormick —a machine that has a record of seventy-two years of continuous success in the harvest fields of the world.



Write for a "Model Machine," which tells how to guard your interests in buying harvesting machines.

Samson Windmill Stronger than The Storms

WHEN YOU BUY A WINDMILL

You buy it for a long time and your money entitles you to the best. No other piece of machinery has as much constant wear. The mill that stands the weather—fair and foul—365 days and nights in the year must be built right or go to pieces. Better buy right once than wrong many times. Our

Samson Double Gear Windmill

is the result of years of study and the expenditure of large sums of money, which have produced a perfect mill. The **Samson** is the very acme of windmill construction. All others are merely windmills; the **Samson** is more than a windmill—it is a wind *machine* built on scientific principles that place it far and away ahead of all others.

Among its many **strong features** found on no other mill, stands most prominently its **double gear,** which in reality is two sets of gears or two pinions and two spur gears engaging each other, and making two trains to transmit the power of the wheel to the pump. This feature is the most valuable one ever incorporated in a windmill. With its four bearings, in place of one, the strain of the load is distributed to four points, giving the very minimum of friction, resistance and wear, and the maximum of power and endurance and doing away with all overhanging strain. This double gearing and its bearings retain their rigidity and tightness under all conditions. The **Samson** has five times the strength of any other windmill using a like amount of material and at the same time is the lightest running of any on the market. Other points of superiority are many, among them durability, high-grade material, skilled workmanship on all parts, easiness of running in slightest breeze, detachable boxings, perfect brake and governor, double pump rod and guide, wick feed oilers, etc. You should know more about the **Samson.** We tell the story in a beautifully **illustrated booklet** that has cost us thousands of dollars to print. It is yours for the asking. Write today. You will be glad if you do.

how much money you can save and how much better stove or range you can get, you'd send to-day for full particulars about the
KALAMAZOO Steel Stoves & Ranges
Sold direct from our factory on 360 Days Approval Test, backed by a $20,000 bank bond. We guarantee perfect satisfaction or ask no pay. We pay the freight. Ask for catalogue No. 163.
KALAMAZOO STOVE COMPANY, MFRS., KALAMAZOO, MICH.
All our Cook Stoves and Ranges have patent oven thermometers.

WATCH THE BLACKBOARD

THIS new style **Suspended Bowl Factory Tubular Separator** is just as far ahead of other factory separators as the **Sharples Tubular Dairy Separators** are ahead of the old style "bucket bowl" dairy separators made by all of our competitors. The **Tubular** is different from all other separators; it's much better, and that's why we make it instead of the "bucket bowl" machines which we used to make in common with our competitors. Here's . . . . . .

WHAT THE TUBULAR WILL DO

We just have an unsolicited letter from H. M. Zook, the well known creameryman of Topeka, Ind., under date of April 2nd, 1903, reading in part as follows: **"The new machine will skim down to one one-hundredth right along through the entire run. It runs very nice all the time. It can't be beat in my opinion."** If you want further information from a disinterested party write to Mr. Zook. If you want to know the liberal proposition we are making on this machine write us to send you Catalogue No. 144. . . . . .

Manure Question Again.

ED. HOARD'S DAIRYMAN:—It is really interesting to read the different views expressed by the farmers in your paper about this manure. I venture to say that the majority believe the better way is to spread it as fast as it is made, every day, right from the wagon. I think that Mr. R. L. Hinman is right, spread as it is made every day. As I said before, "40 loads that was put in one big heap in the winter, after laying, there were only 32 loads, a loss of 8 loads." I have been drawing all winter and spreading on a side hill meadow one rod from the fence, ground frozen, had plenty of rain, and I want to see if the grass is any larger from this liquid running away, as many think it will. At the New York State Dairymen's Convention, this manure question was being discussed and the question was asked about washing away. Mr. Fenner said: I "heard Prof. Roberts say that they had analyzed the coloring matter that is sometimes seen running away. It is of no value, it being tannin. There was no effect from it seen three feet from the pile of manure which they left in the field."

Very few farmers now draw in small heaps and then spread it in the spring, handling it twice. I make during the winter a wagon load every day that would be two heaps. Supposing I should make two heaps every day, that would be, say, from middle of October to 20th of May, some 420 large heaps. How long would it take a man in the spring to spread those heaps (I top dress meadows, do not plow any) at $1.50 per day? and besides where those 420 heaps were, the grass would all lodge down, and you could see the effects of those heaps for some time. The best, least trouble, is to draw it out every day and spread it, and most all the farmers that read your paper (including yourself) do it. This leaching and running away is not as bad as some think it is. T. F. KELLY.

N. Y.

The Manure Question Still.

ED. HOARD'S DAIRYMAN:—Will the "manure question" stand the experience and practice of another of your interested readers? If so, would like to say that for twelve years I have been hauling direct from the stables to the field at all seasons, and three hundred and thirteen days in the year and the longer I do it the more I want to. My rotation of crops is corn, oats and peas, and clover. I try to get there with the corn every fourth year.

As all the manure goes on top of the ground, we begin after the oats and peas are off (about Aug. 20) to top dress the new seeding, using about 12 loads per acre. After this the potato ground for next year is manured—25 loads to the acre. Next comes the corn ground, with 18 to 20 loads per acre. This takes us up to about May 1st.

A brother granger was asked in my hearing how long he top dressed his meadow in the spring? "Till the sled-beams knock the grass over," said he. So from May 1st "till the sled-beams knock the grass over" I top dress the orchard and the older meadows. Usually there will be—after the grass has become too large to spread the manure upon—three or four weeks before time to begin haying. During this time we go for the pasture field. With 25 cows and a span of horses, cows kept in the stable nights with tight gutters, in four weeks we can make as many acres of fine pasture for September and October, provided we have a good sod to start with.

The late Josiah Smith, of our county, once remarked in the DAIRYMAN: "That he liked to travel over a pasture that felt like a Brussels carpet under his feet." Top dressing, as above, will make that kind of a field. Our hired men have all thought it very odd, and some have said: "You are throwing your manure away to put it on the pasture." But after watching results, they have said: "If ever I have a farm I'll manure the pastures."

New York. J. Q. BARLOW.

What Kind of Salt for Stock

What kind of salt is best for stock? Is rock salt all right? PIERCE CO. FARMER.
Wisconsin.

Any salt is good, but for convenience and economy there is probably nothing better than the rock salt which comes in large lumps, and can be put out in boxes where cattle can have access to it at will.

California Questions About Milking Machines and Stanchions.

ED. HOARD'S DAIRYMAN:—I am a renter and we are just starting in the dairy business. I have followed the business for seven years and I would like your advice on two or three subjects.

We are thinking of putting up a good cow barn, so I have been watching everything in that respect in your paper, but those eastern barns are different from what we need, as we do not have to fight against the cold. Just a plain board barn will answer here. I think of a barn 100 ft. long, an 18 ft. shed on either side, with stanchions, and a 6 ft. feed space in front of stanchions and a floor with gutter in for cows. I think of having the hay mow 30 ft. wide with 24 ft. posts and put hay in at both ends. We have alfalfa, but have to irrigate. I am arranging for my cows to come fresh in the fall and then let them rest in July and August, as these two months are very dry and hot with plenty of horn flies with us. We cut four and five crops of alfalfa per year and then pasture it in fall.

Now, as I do not wish to impose on your valuable time, I will proceed with my questions.

Milkers are a hard proposition with us. They will quit, or abuse your cows, or their horse, or do a hundred and one things to make it both unpleasant and unprofitable for you. I don't think it is altogether my fault as I have from 4 to 6 men all the time and have no trouble with the other men.

Well, question No. 1 is: What do you think of the Sharpless milking machine? Do you think they will give satisfaction? I will milk from 60 to 100 cows soon and have steam engine also a DeLaval Turbine. We ship our cream.

Question No. 2: In your judgment what is the best stanchion? I want something I can leave my cows in over night and not cripple them—that is, in stormy weather when it is blowing and raining. I hate very badly to turn them out in the storm, but if kept in the ordinary stanchion they stiffen so.

I would like very much to have a silo as we can grow corn for fodder very easily, but it will not ear, but we tenants have to be contented with what we can get, not what they think will pay.

Now, if you can find any items in this that you think would be of general interest, why you are welcome to use, if not why consign to waste basket, but please just sign CALIFORNIA.

The Sharpless Lactator promises well, but it has not yet encountered the crucial test of actual use among practical dairymen, and until it has passed this ordeal it cannot be unreservedly recommended, much less condemned.

For restraining cows while feeding and milking there can be no serious objection to the old-fashioned rigid stanchion. And for occasional use during stormy weather we do not consider they would be specially objectionable, but, of course, one or other of the patterns of swinging stanchions, or some style of tie or stall would be preferable. This correspondent appears to be a progressive sort of dairy farmer and we feel sure he would get much pleasure and no little profit from having a copy of King's Physics of Agriculture at hand for ready answer to innumerable questions that arise from time to time on the farm—among others matters pertaining to barns, stables, stalls and cow ties. The price of the book is only $1.75 from this office, postage paid.

The Hog House I Have Built, and the Hog House I Would Build.

ED. HOARD'S DAIRYMAN:—Replying to your request for plan of my hog house. I herewith hand you plans, both of my own house, and that of a much better one.

After my criticism of my own hog house, in a late number of the DAIRYMAN, I am surprised that anyone would want

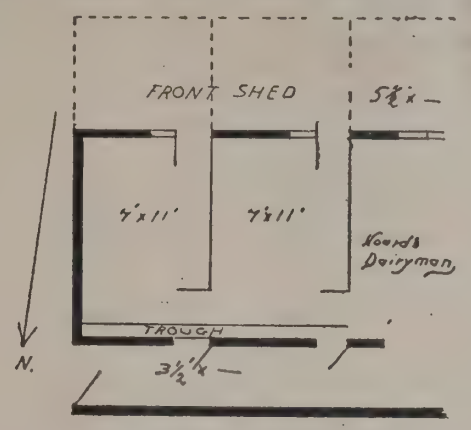

FIG. I—GROUND PLAN OF HOG HOUSE THAT I HAVE BUILT

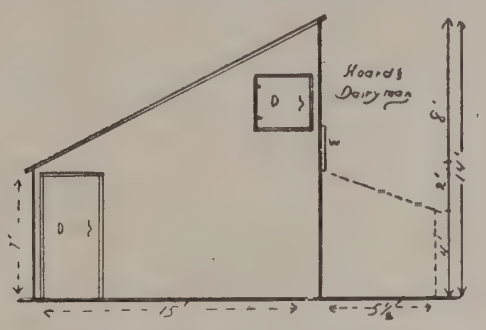

FIG. II—END VIEW OF ABOVE

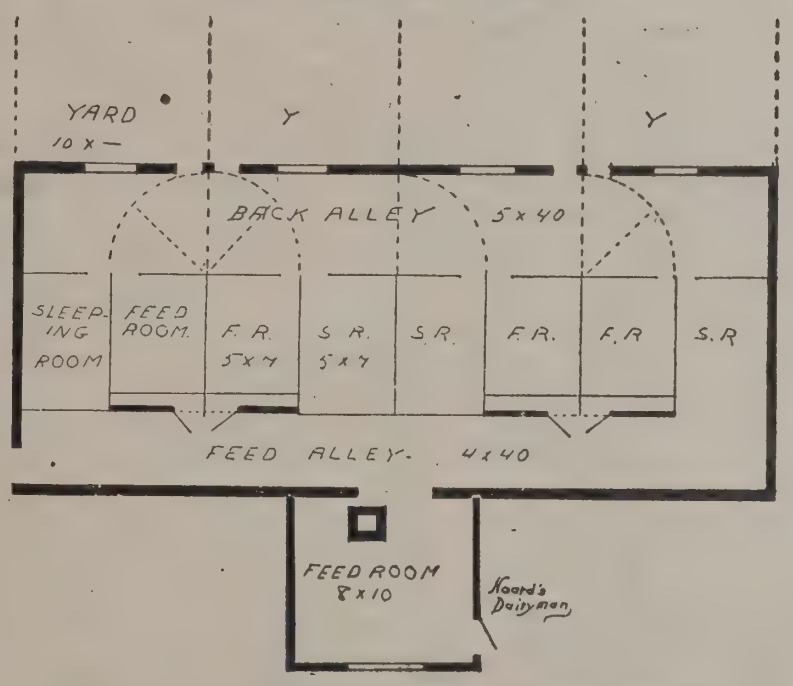

FIG. III—UP-TO-DATE HOG HOUSE AS I WOULD BUILD IT

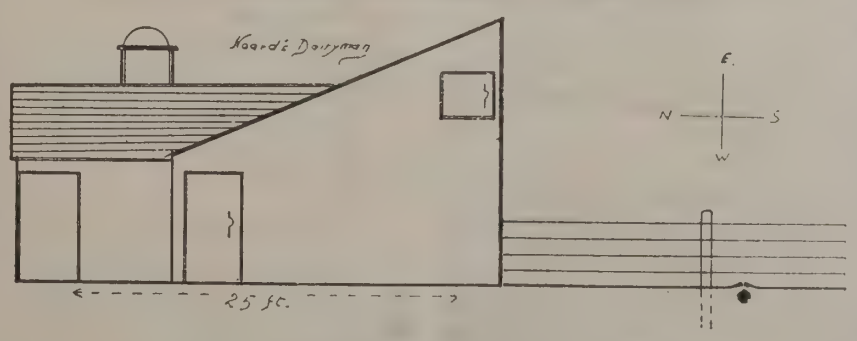

FIG. IV—END VIEW OF ABOVE HOG HOUSE

to build like it. I said that my hog house was built on the plans of Mr. Theodore Louis' hog house, of Dunn Co., Wis., and that I did not like it at all, and that I was considering adding improvements, as I thought, to the internal arrangement, which however proves only to be a make-shift. The best improvement in this house, is the low front shed, as shown in this plan.

Let the reader look over my letter, in the DAIRYMAN of Jan. 30, and he will understand much better about this shed arrangement. As I say, it is only a make-shift and I do not advise anybody to build after this plan. By comparing this plan, and the plans of Mr. Louis' house, so widely illustrated, it will be seen that mine is precisely the same. For why should it not, as I built exactly after his plans and as already said, am disappointed, and would advise no other to build like it. Therefore, see article in January 30th DAIRYMAN, which explains these things, and I do not want to reiterate.

Now, if anybody wants to build a hog house, I submit plans of up-to-date house which is sure to give comfort and satisfaction. The plans show a house 40 feet long. It may be only 10 feet and it may be 20, 30, 100 or any multiple of 10. It will be seen there are the indispensable departments in each pen, sleeping room 5x7, feed room 5x7 and brick alley 5x8, besides yard and feed alley. In order to come out of sleeping room, it will be seen, pigs have to pass out through back alley, where they are sure to leave their droppings, leaving the other rooms clean. Beginning at one end with a sleeping room the enclosures go in pairs as the plan shows. First nest, then a pair of feed rooms, then a pair of nests, and then a pair of feed rooms, etc. In fattening time the division planks between the pairs may be lifted out and the pairs made one enclosure 7×10. The nest room floor and feed alley floor are some two inches higher than feed room and back alley floors. This ensures dry nests and walks. The floor is best and warmest partly of cement. The front should face the south. On the central north side is the feed room. The one outlined in plan is 8×10. This is large enough for a 40 foot house; for an 80 foot house it should be twice as large, 5×7 will be found ample size for pens on this plan. A steam cooker, should be in this feed room to heat water, steam food for brood sows and young pigs, etc.

The roof is shed roof, which is the best for a hog house. There is a loft over head to be filled with straw for bedding and ventilation. J. A. M.

New York.

Farm Methods in Denmark.

ED. HOARD'S DAIRYMAN:—I am a Dane, and learned farming in Denmark, but it is now 30 years since I left that country, and both farming and dairying have changed and advanced since then. At that time the object of all farmers was to get manure and enrich the land. They sold nothing off the farm but wheat and fed all that they could raise to their stock, even the straw they took good care of Horses were seldom fed hay, but had oats and chopped straw (oat and wheat straw); barley straw was reserved for the cows and pea straw for the sheep. The manure was gathered in a heap outside the stables, where a pit from 4 to 5 feet deep had been made, and was hauled out on the summer fallow during the summer. The farmers had their land laid out in fields, the lowest was six fields and some had as high as 10 fields, and one field was manured once every year, so really the number of fields depended on the amount of manure a farmer could produce as it took more manure to cover one-sixth of the farm every year than one-tenth. They always used rotation of crops. The grass field was pastured over the first thing in spring by the sheep, then it was plowed shallow and the thin sod broken up with the cultivator and then harrowed with a spike-tooth harrow till all the dirt was shaken from the roots; after it was all wilted the manure was hauled on, and plowed in with a deep but narrow furrow. The idea was not to turn the top soil and manure to the bottom of the furrow, but have it so it would, by the leaning of the furrow, fall down a little on the side of the first plowed furrow, and in that way it was covered but not deep. After plowing in the manure it would lie a while, then it would be harrowed again and plowed again, no wider furrow, but from 6 to 8 inches.

Some farmers would plow it once or twice more before fall, for sowing the winter grain (wheat or rye). The next year, after the harvest in the fall, the stubble would be plowed and lie that way during the winter, to get the benefit from the frost, and in spring it would be sowed to barley. When that was harvested the stubble would be fall plowed, and in spring sowed to peas, mangel-beets and rutabagas; after that was taken off the land, it would again be fall-plowed and the following spring sowed to oats. After the oats were sowed and well harrowed in, 15 lbs. to 18 lbs. of red

clover, 15 lbs. of rye grass where the land was rather dry, and where wet, 15 lbs. of timothy would be sowed in place of rye grass.

The oats were cut that summer for grain, and before winter, the clover and grass would get a start and the next summer there would be a fine stand of clover; that clover was cut for hay and after it had gotten a good growth again, it was fed to the cows and horses. The next spring a good deal of the clover had been winter-killed, but the grass filled out their places, and that summer the cows and horses were tethered on it. This made 7 fields, but with most farmers this field was kept for another year and used for pasture for young stock and sheep, so that would make eight fields.

These fields were laid out permanently and there was no fencing, the land being too valuable for that. Barley and peas were used for the milk cows and for fattening pigs and sheep and cattle, mangels for the cow and the rutabagas for the sheep and for fattening cattle. The only thing bought in feeds, were oil cake, of rapeseed and flaxseed. The rapeseed cakes were broken up and fed to the cows and the flaxseed cakes for sheep and fattening of stock. Hogs were fattened on barley, peas, buttermilk and whey.

There was an expression used among the dairymen, which I never hear of here, it is, "some feeds are used in the milk making, and other feed forces or accelerates the production of milk," and rape-oil cakes were considered a milk forcer; it would increase the milk production, but would not in itself make milk. Oat-straw was considered to have the same virtue. It was known among the farmers, that when you started to feed a cow oat straw, when near calving, she would commence to make bag and throw the calf (abort.) It was claimed that the bag and the calf affected each other, that if by some cause the bag should develop and the milk start flowing, then the calf would be born, therefore, the oat straw forced milk production and the other organs were affected. There may be some relation in the feed in that way, which seems very natural, but might never be thought of and would be a new line for the Experiment Stations to work on. There are many such ideas, or perhaps facts, that are so well known among common people, that a fellow hardly hears it mentioned, but if known to students, might give light on something otherwise obscure.

There was another thing that surprised me some, and I thought when reading it, that it was an exploded notion. It was about "Sex in Breeding." First, the inquirer asked if there are some bulls that always breed heifers and some the reverse? I had some experience in that line this season. I have 5 cows but no bull (Jersey grade); my neighbor has 6 or 7 scrub cows, and a bull of his own raising. I keep my cows up, his roam about, and the bull with them. Had no chance last season to get my cows bred, I used his bull, so when any of my cows wanted the bull I had to hunt him up, so the cow was mostly far gone in heat, before they got served. I knew I would get bull calves, but as I didn't want to raise any heifer after that bull, I did not care. All the calves my cows got were bull calves, and my neighbor had all heifer calves, and that was the same bull. Then he asked: "Is there any way to influence the sex in breeding?" Before I came to this country I thought it was well understood that by breeding a cow right off when she comes in heat, she would then give a heifer calf, and that it was practiced in Switzerland, and known not to fail.

Another neighbor, 1½ miles below me, had for a time a Jersey bull and I brought my cows there, as I wanted to get heifers, I tried as near as I could to bring them in the first of the heat, and I did get some heifer calves I told my neighbor there about getting heifer calves in that way, and he said he knew that, but he did know the cause. The reason I had for it was when the egg drops into the womb, the animal comes in heat and desires the bull, and if she gets impregnated before she has gone a certain time, she will get a female offspring, but impregnated after that certain time she gets a male offspring. I always believed it to be a fact, and have not heard anything to the contrary, and I thought it was well known to science, and it seems to me so many things point that way as proof. It looks too as the way of nature to balance the sexes, where they are left to nature. Take the deer for instance, if there were many vigorous bucks in the band, the does would be quickly served and females in the majority born; on the other hand with few and poor bucks, many females would not be on time, and consequently the majority of the offspring would be males. And so the Czar of all Russia might get a boy if he was not so desperately anxious to get one.

Redding, Cal. GEORGE MEDING.

What Crops Shall the Hamilton Co. Farmers Raise?

(Extracts from an Address at a Farmers' Institute at Harrison, Hamilton Co., O., by P. CLAWSON.)

To the student of Agriculture it must appear plainly that there is something wrong with farming. Upon the whole it is probable few other occupations call for greater diligence and economy by the entire family than farming. And especially does this seem true of recent years. We are provided amply with improved machinery and transportation, yet we fail, especially in Hamilton County, to produce what we once did.

But is Hamilton county worse than others? We answer, the best is bad enough, but Hamilton county worst of all. Why? First, because it has more to lose than most others; bounded by the great Ohio River and traversed by several large tributaries, it possesses a rich, loamy soil, surpassed by none and equaled by few. Second, it contains within its boundaries one of the largest cities of the greatest country that God ever gave to man, and large cities, like large trees, are heavy feeders upon the surrounding soil. Why, there is a demand in Cincinnati for anything that can be produced upon the farm, from a stalwart lad of unquestionable integrity to a case of last summer's eggs of the most questionable character. And we have stripped our farms of their products and carted it off to the city, thereby robbing the land of its productiveness until the glistening sands of the valley and the rock ribbed hills bear a manuscript of lost fertility that it does not take a Daniel to interpret.

I say, gentlemen, that this is wrong, emphatically wrong, and that by a continuance of this system we will continue to be worse hampered by poverty and hard work. The remedy is: Raise feeding crops and not market crops, and feed them upon the farm. Were you aware that the corn belt, of which we are the center, is the greatest animal growing tract in the world? Yes, we state it without hesitation, the corn belt, which is also the blue grass and clover belt, beats the world in its ability to produce animals cheaply and at the same time retain its fertility, and the man that raises a market crop, is simply casting pearls before swine. And we repeat it without hesitation: "Raise a feeding crop by all means and of this, Corn is King."

This brings us to our subject for tomorrow:

CORN—BLUE GRASS — ALFALFA — SILOS.

We endeavored to say yesterday that the reason we did not receive a recompense for our labor, equivalent to other occupations, was because of the depleted condition of our soil, due to raising market crops, and that the remedy was to grow stock and raise feeding crops; and that the sun in his journey did not throw light on a single land that could compete with the corn belt in stock raising, and of all the feeding crops *Corn was King*, and that our acreage to corn should be limited only to the amount we could raise without loss of fertility, that it was our plan to silo the entire crop, and carefully save the fertility originating from feeding same, and return it to the field.

Blue grass: This probably is one of the worst abused blessings known to the corn belt. It comes without our bidding or sowing; it meets us at the curbstone and lies at our feet at the threshold begging for recognition. Our minds invariably picture an old, worn out, abandoned field as a blue grass pasture, but this is the greatest prodigality, it is worthy of our best treatment; dress it with coarse, unrotten manure occasionally and keep the stones and grubs out and it will pay you handsomely. The Iowa Station finds to disc it and sow 10 or 12 quarts clover seed to the acre, adds 65 per cent to its productiveness and lasts several years.

Alfalfa: For seven years we have been trying to learn the habits of alfalfa and have now about 15 acres of valley land along a small stream, as well set as we could desire. We mowed it four times last year, and estimated that we got full 6 tons cured hay to the acre. As a hay it is unequaled; fed to cattle with corn silage, we get a balanced ration without additional grain, and our stock does well. As a soiling crop it surely can not be equaled. We prepared our soil as thoroughly as if we were going to put it to onions, and sowed 27 lbs. good seed to the acre, covering with weeder and roller on April 10th, 1901.

SILOS.

Now gentlemen, I expect that your bristles are all up, because I know the feeling here about the silo system. But I will say they have come to stay. I have used three silos for seven years, and do not hesitate to say they offer a system of securing the corn crop, unequaled. It would have paid me to have built more room last fall, if I never used it but once. You all know the deplorable condition of our shock corn. I have siloed red clover with great satisfaction and expect to silo my first crop of alfalfa next year, especially if it is as wet as last year.

P. C.

In re Gurler's Method of Milking.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of March 13th, on page 15, Charles S. Pope, of Manchester, Me., says we have adopted H. B. Gurler's method of milking through absorbent cotton.

Mr. Pope also says his cream will keep sweet two weeks in a temperature of fifty degrees.

Now Mr. Editor, please be kind enough to inform us through the DAIRYMAN, Mr. H. B. Gurler's method of milking through absorbent cotton.

We always strain the milk at the barn and again at the house before separating. Question, How would it do to put cotton in strainers at the barn and cover the cotton with two or three thickneses of cheese cloth, and as we always do, let each milker strain milk immediately after milking each cow.

Why is not this plan as good as milking through the cotton, placed some way on top of milk bucket.

Now if this is not asking too much, please let me hear from you at your convenience and oblige an old subscriber.

El Paso, Tex. R. WRIGHT.

See article by Mr. Gurler, on page 210, for information regarding the use of absorbent cotton.

Ringing a Bull.

ED. HOARD'S DAIRYMAN:—"G. S. W.," of Unity, Me., asks for method for ringing bull. I have found nothing so handy as a wad cutter, such as is used for cutting wads for reloading shells for the modern rifles. The .32 caliber is the right size, and 40 cents the price, to be had wherever fire arms are sold. Attach a handle to facilitate handling. Have a helper place the handle of a heavy hammer in one nostril, pressing it against the division cartilage. Insert wad cutter in opposite nostril and strike with hammer or mallet, and you have a clean cut hole just the proper size for your ring.

NATIONAL
Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitab than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each..... 4 50
No. 4,—4 bottle, complete for testing cream and milk, each..... 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

Aconite a Fatal Drug in Milk Fever.

ED. HOARD'S DAIRYMAN:—Will you please give the reasons for your statement in reply headed, Milk Fever, on page 91, that "it is quite likely that your dose of aconite thus helped to shorten her life?" From your correspondent's description the case was apparently a sthenic one, accompanied by fever. Although the Schmidt treatment is a perfectly safe and most efficient method, and one which should be employed in all cases, your statement as to the use of aconite seems to me a very strong one as applied to the congestive cases of milk fever.

Granted that aconite decreases the force and frequency of the heart's action, it, at the same time, causes arterial relaxation, and allows the blood to flow away from congested areas. It is not as powerful as Veratrum Viride, as far as its depressant effect upon the heart is concerned, yet the latter drug is recommended as applicable to the conditions existing in sthenic milk fever by authorities like Winslow in Veterinary Theraputics, and Dr. Brain in Bovine Obstetrics. Prof. Law, in the special report on Diseases of Cattle, says: "In these congestive cases benefit is often derived from large and frequent doses of tincture of aconite."

Aconite is no doubt a dangerous drug, and one to be administrated only with full knowledge of its physiological action, and the existing conditions in the circulatory system; but in such a case as the one described by your correspondent apparently was, I do not see why the aconite should be held contributory to the cow's death. H. C. H.

Stockbridge, Mass.

While you appear to be well acquainted with the physiological action of aconite, you do not seem to understand the nature and pathology of the disease in question. We fully agree that the medicinal use of aconite is to antagonize the fever process, and that it is indicated in all affections characterized by a high resisting pulse, dry, hot, skin and elevated body temperature. Your authorities will also agree that aconite in large doses paralyzes the cardiac muscles and its contained ganglia, the respiratory centers, and the spinal cord in all its functions.

When a cow shows symptoms of milk fever and finally resumes the recumbent position, you will find that she has no fever whatever; on the contrary, her temperature is below normal, her skin cold and clammy, and as the disease advances, the entire body becomes paralyzed. There is no congestion, but the brain shows marked signs of anaemia, hence the comatose condition. In each and every one of the above conditions, aconite would be contra-indicated, and, if applied in these stages, a dead cow is sure to follow.

Our correspondent seems to have the wrong conception of what constitutes a fever, the same as some of our old authorities who first named this disease milk fever, when in reality there is no fever. The more appropriate name, which has been recently applied, is Parturient Paresis. When the lay-man tells you his cow had a fever, he does not, as a rule, mean that there is an elevation in the body temperature, which really constitutes a fever, but wishes to express that there are signs of uneasiness, of shivering, stiffness, coldness, etc, and so the name fever is misapplied, the same as in the stages of milk fever above mentioned. In view of the above facts, the writer is of the firm opinion that aconite has killed more cows affected with milk fever than all other drugs taken together, as it has been the custom to use it exclusively and has been recommended by almost all the old authorities in these cases, in the ages when milk fever was considered invariably fatal, which accounts for the great mortality.

A. H. HARTWIG.

Pasteurized vs. Clean Milk for City Trade.

ED. HOARD'S DAIRYMAN:—How many degrees can or do you heat milk to pasteurize it so it will not give it a cooked taste? Can I pasteurize it by heating it in a common 8 gallon milk can? A friend of mine had some he prepared in that way.

I began the milk delivery business in our town 8 years ago with 4 cows, and I had then 4 more cows than customers. I am now running 3 two-horse wagons, delivering an average (daily) of 120 gallons of milk. I have a herd of Jerseys. I am getting an average of 70 gallons of milk a day and raising 7 calves; feed calves fresh milk. My milk test is 5 per cent; herd test by Babcock. I get 6 cents a quart for milk; 37 cows in herd, 2 dry cows in herd. I feel that your paper made me money a hundred told. Greenfield, Ind. R. H.

When the inquirer has control of his own herd and consequently can regulate the quality of the milk produced, it would be much better from a business point of view to supply clean milk as a speciality rather than pasteurized milk, Clean milk produced under sanitary conditions, where stables are kept clean and free from dirt and where the cows are in like condition, has a distinct advantage in the market over milk that has not been kept clean and which requires pasteurization.

Undoubtedly milk can be pasteurized in the common 8-gallon milk can, but to accomplish this requires considerable time and very constant and careful attention. The milk must not be heated above 150° and must be held at this temperature for not less than 20 minutes, and be constantly stirred so as to maintain an even temperature throughout. It must then be cooled as rapidly as possible, with constant stirring as before, down to 50°. It follows that any lack of attention might result in serious loss, and, therefore, extra labor and expense considered, one might better provide himself with a modern pasteurizing outfit.

Corn and Pea Silage,

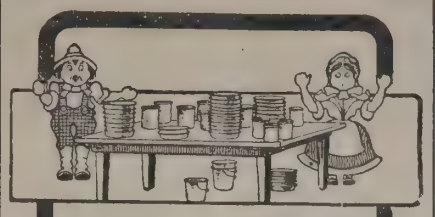
Will you please tell me through the columns of your paper the variety of peas that farmers generally plant with corn for corn and pea silage? Also what do you consider the best variety of corn to plant? Do you know whether alfalfa will grow and do well in Vermont? J. E. M.

East Brookfield, Vt.

We do not know of any variety of peas that can be successfully grown with corn in Vermont for silage. The cow pea, which is in fact a bean, is not at present acclimated in the north, but there is little doubt that like sorghum, it will sooner or later adapt itself to northern conditions and climate. It fact, it is now grown with considerable success in an experimental way. There would seem to be no good reason who alfalfa should not do well in many parts of Vermont. At all events, any Vermont farmer could well afford to experiment with it on a small scale, say not more than two acres at first.

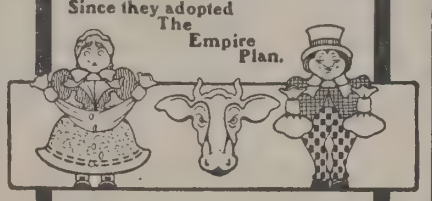
"ADVERTISEMENT."

WISE HUSBAND.



Suggested a Food Cure.

All of the medical skill in the world is powerless to cure certain diseases unless the patient is put upon pure, scientific food. Then the disease seems to cure itself in many cases, proving that nature was demanding proper food to build a healthy body from.



In this simple way the use of Grape-Nuts in place of bad food has worked many cures when medical skill has been exhausted. A lady of Plainfield, N. J, who had been an invalid for over 10 years, says: "I have been treated by eminent physicians of New York, Brooklyn and Newark, besides taking innumerable proprietary remedies of a cathartic nature to regulate the bowels.

"My last physician advised a sanitarium but my husband who had been reading one of your articles said, 'Not until we have tried the boasted virtues of Grape-Nuts.' So we got some and I have now used Grape-Nuts for 8 months. When I began its use I weighed 85 pounds, now I weigh 105½; my stomach has grown strong and normal, my bowels are so regular that I have thrown cathartic physic to the dogs, the vertigo has left me and my whole system has gained vigor and tone. I can now take a 25 mile ride on my bicycle and enjoy it.

"I am convinced that the chief cause of my ill health was improper food that neither digested nor nourished. Since I have been fed right I feel right." Name furnished by Postum Co., Battle Creek; Mich.

A long time ago, when they first began
To keep milch cows, poor Dairy Dan
And Milkmaid Molly had troubles galore,
And always seemed to be getting more.
They'd work and worry and stew and fret
And always would end the year in debt.
But by and by they found a way
To lessen their work and get more pay.
They bought an Empire, and every cow
Is yielding a handsome profit now.
They're Jolly Molly and Dandy Dan
Since they adopted
The Empire Plan.

The Easy Way

is not always the best way, but it so happens in the case of the

Empire Cream Separator

that it is both the **easiest** and the **best.** The Empire runs more lightly than any other separator of the same capacity; it is more easily cleaned, because it has few parts; it lasts longer and costs less for repairs, because it is better built and freer from intricate mechanism. In short, it is the simplest, most efficient hand power cream separator made. We guarantee that it will do better work with less labor and trouble, than any other separator, and all we ask is a chance to let you prove our claims to your own satisfaction. What do you say?

Let us send you our good book on "Making the Dairy Pay." It's free for the asking.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

IGNORANT WORK.

Not long since we heard a young man declare that he did not propose "to stay on the farm and do *ignorant work all his life.*"

That was a new thought to us—"ignorant work." We wonder if there are not thousands more young men, just like him, who are running away with this same silly thought, that farm work is ignorant work. If so, how shallow, how superficial, how ignorant is the thought.

The fact is there can be nowhere on earth, any such thing as ignorant work. All work if rightly done is based on intelligence; all work has to deal with laws governing matter and these laws are as deep as matter itself.

It is true there are plenty of ignorant men engaged in all kinds of work, even the work of statesmanship, but their ignorance is a part of themselves, and not of the work.

We once employed an old Irishman by the name of O'Brien, to dig a ditch. Our young man no doubt would say that this was ignorant work. But Mr. O'Brien thought differently, and the ditch showed it. It was an exceedingly fine, well finished piece of work. We felt enthusiastic, and remarked: "O'Brien, that is a ditch fit for a king-" The old man made a polite bow, and said;"Sir, the O' Briens were kings once."

Ah! there was the royal spirit. He had not forgotten that he came of kingly blood, which was true, and he took a kingly pride in what ever work he did.

All work requires study, understanding, intelligence.

There is no such thing as menial or degrading labor. The work of the farm, takes hold on the most profound principles of science. How then can it be ignorant work?

What an ignoble, menial idea of work that young man had. The curse of such ideas is far reaching. They are making rascals of thousands of young men, and prostitutes of young women. They are born of ignorance, falsehood and deceit. The disgrace of American agriculture today, is not in the character of its work, but in the fact that there are so many farmers, who by their own ignorance, cause their children and others to think that farming is ignorance.

ENTERED into rest, Monday, April 6th, at Gananoque, Ontario, Eliza Maria (Mrs. E. M. Jones), wife of Chilion Jones, in the 66th year of her age. The funeral was held from her late residence, Belvedere, Brockville, Ontario, Thursday, April 9th.

Mrs. Jones was widely known as a most successful dairy woman and breeder of high class Jerseys. She has done much both by personal example and by precept to emancipate the dairy cow from the thraldom of neglect and abuse and to insure her the treatment and respect and consideration due to motherhood. She was a useful citizen, one of the kind that leave the world better than they found it. She exemplified in her daily life the dignity of labor and lost nothing of respect or social prestige by reason of her intimate association with cows. This came largely from the fact that the work of her hands was both intelligently conceived and intelligently executed.

Mrs. Jones was the author of that classic little booklet, "Dairying for Profit" which has had probably a wider circulation both in Canada and the United States, than any book of modern times, and the beneficient influence which it has exerted and will continue to exert for years to come is simply immeasurable.

AS YOU LOOK AT IT?

Whether a man sees the truth or not depends very much on the way he looks at it.

At the late meeting of the National Creamery Butter Makers' Association in Milwaukee, two creamery owners were conversing. One of the men whom we will call Mr. A. was an enterprising sort of man who took great interest in the growth of sound dairy knowledge among the farmers who were patrons of his creamery. The other, Mr. B., was a different style of a man. He owned a creamery, indeed several of them. They were talking about the convention when Mr. A. said:

"This is a splendid meeting. I wish every one of my patrons could be here and take it in for all it would be worth to them. Some of them would see things differently than they do now. I notice every time, that the patrons in my creamery who make the most money, who furnish the best milk and who are the most valuable to me, are the ones who attend the farm institutes and dairy conventions, read dairy literature and try to make themselves intelligent dairymen. I have been holding meetings among them every winter, and I try and get them to read on this dairy question all I can. It has done my business a great deal of good and they are doing a great deal better than they used to." Mr. B. replied somewhat as follows:

"Well, so far as I am concerned, the less my patrons know about the creamery business, the better it is for me. All I want them to do is to make the milk and I will take care of the rest.

When you try to stir them up and make them intelligent, as you say, you are only making trouble for yourself.

That's my experience. Not half of my patrons can read your dairy literature, as you call it, and understand it when they have read it. I don't care how ignorant they are if they will only make plenty of milk. It is not my business to help them make money."

Now, that conversation, which was reported to us by a third party, represents very closely two classes of creamery men. One is a live, public-spirited citizen who sees the breadth and depth of this great dairy industry. He realizes that the foundation of it all is the dairy farmer. He sees that he cannot build a fire for himself alone, and leave the farmer out in the cold, no matter if the farmer don't want to be warmed and benefitted, as is often the case. He sees also that the great foe to the prosperity of the men about him is their lack of knowledge. If he can get them to see things as they really are, they will be benefitted and it will benefit him too.

The other man is too selfish, too narrow to do the best for himself even. All he is looking for is the present penny. He had rather have the farmers about him ignorant of the Babcock test and many other things. He can more easily take advantage of that ignorance to his benefit. He is afraid that his patrons will become intelligent enough to hold him to a strict accountability.

Now, which of the two kinds of men is the best for the patrons to do business with? Which should they encourage the most?

This shows clearly the truth of what HOARD'S DAIRYMAN has always contended for: That it is to the highest interest of the patrons of every creamery and cheese factory to take hold of their own dairy education vigorously. They can not afford to be dull and indifferent on dairy questions.

This is invariably true. A set of wide-awake, well posted farmers will always have a bright, well posted creamery man. They will always be well and honestly served. But it does not follow that a well posted creamery man has an intelligent set of patrons. Sometimes he does not want them to be too intelligent.

SOME WISE IDEAS ABOUT COWS.

In the Journal of the British Dairy Farmers' Association for 1903, we find an address on "Breeding and Feeding for Milk," by Mr. John Evens of Burton, near Lincoln, Eng. Mr. Evens is one of the most noted of English dairymen and his address gives evidence that he has made an exhaustive study of his business, from the breeding and selecting of a bull, to the smallest detail in other departments. It is very interesting to follow the thought and speech of a man who has a right to know what he is talking about. We copy some of his ideas.

Rightly enough he places great stress upon the breeding of his sire. On this point he makes several good statements such as the following:

"I consider the bull more than half the herd when breeding for milking qualities. In other words, I consider the influence of the bull in handing down the milking characteristics is stronger than the cow. * * * This question of the bull I consider the very weakest link in our dairy breeding. Men will naturally keep their best cows, but very many are satisfied to either buy or get the service of any bull, provided the fee is low enough; * * * he may be from a short-necked, steer-headed cow without a bag, yet he is expected to get good dairy stock."

In confirmation of this theory, Mr. Evans cites the history of several bulls to prove how valuable they were because they had "something to give" to their heifers, which they had inherited from their mothers. The bull, "Beauty Bull" from the famous cow, Beauty, sired Burton Old Profit, a cow which averaged 11,000 pounds of milk a year for 7½ years. Also he was the sire of the following cows:

					Gals.
White Tail 2nd.,	yielding after	1st	calf	.....	795
"	"	2nd	"	.....	1338
"	"	3rd	"	.....	938
Stores H	"	1st	"	.....	380
"	"	2nd	"	.....	857
"	"	3rd	"	.....	1367
Little Robin	"	2nd	"	.....	603
"	"	3rd	"	.....	887

He says further:

"Some cows breed good heifers and moderate bulls, some *vice versa.* For instance the cow Beauty never bred me a female that was a patch on herself, yet her son sired a lot of good dairy cows."

He cites also the history of the bull Professor, bred from his best dairy cow. This bull sired 16 heifers, the poorest of which gave 558 gallons, or 5,580 lbs. of milk in her first year, and the highest 10,300 lbs. in her second year. Of these heifers, 8 gave in their first year an average of 7,590 lbs. of milk. In their second year the whole sixteen averaged 7,940 lbs. of milk each, for the year.

This is a remarkable record from one herd, for a sire. He quotes a Mr. Marshall, also a representative dairyman, who had a somewhat similar experience with a very prepotent sire and who says: "I am certain that the bull is more than half the herd as far as milking qualities go."

American dairy farmers will do well to heed these ideas, coming as they do from men who have worked the problem out to a demonstration.

Here is a bit of testimony from Mr. Evens which has the true dairy ring in it on the feeding question:

"A cow, of course, requires a large proportion of bulky food, but a milking cow has a great amount of work to perform; we must give her a digestible food, and the chief difference between feeding a beef and a milking cow is, that the latter milks better on and requires a *moist* food."

In that last sentence Mr. Evens has struck the key note to the silo question.

Every farmer knows how much better cows will do on plenty of succulent (moist) pasturage. Milk is 87 per cent water. The water in the well or creek is not an equivalent, in milk making, for the distilled water in the grass or ensilage. As the grass dries up the milk flow shrinks, while the cow may grow fat. Ensilage is a moist, succulent food. In providing it, the farmer is helping the cow to do her best for him.

CONNECTICUT DAIRYING.

Mr. John B. Noble, Dairy Commissioner of Connecticut, gives some quite interesting facts in his report.

There are 26,948 farms in that state a large portion of which are devoted to dairying. The total value of the annual dairy product is $7,090,188 or over 32 per cent of the total value of the whole farm product. The milk trade for the past year consumed 33,879,466 gallons; of cream 10,411,902 gallons. The total production of butter was 8,480,194 pounds. Of this the farm or private dairies produced 4,591,789 pounds; the creameries 3,858,405 pounds.

There has been a decrease of butter production owing to an increased demand for milk and cream. The Commissioner says: "Good healthy milk cannot be produced from cows kept in dark, ill ventilated stables."

A few years ago we visited a large number of dairy farms in Connecticut and Massachusetts where it was the practice to dump all the manure into cellars immediately beneath the cows. We had a good many arguments with the owners about this, to our way of thinking, very unsanitary way of stabling cows. This practice seemed to prevail mostly in the New England States. We have always believed that when the dairymen there come to think more thoroughly on this question, they would conclude to discontinue this practice and we are glad to know that a change is being very vigorously agitated, on that point.

Michigan Dairy Returns.

ED. HOARD'S DAIRYMAN:—I have seen a number of records of dairy herds in the DAIRYMAN during the past year and in

reading them I think it gives us all an impetus to try and make our own herds do better. I give you herewith the record of my herd for the past year. The year began April 1st, 1902, and ended March 31st, 1903. Number of cows milked during the year, 24, of which six were heifers with first calf. We made from these cows, 8067 lbs. of butter, which is 336 lbs. per cow, and sold it for $2077.31, making an average of $86.55 for each cow for butter sold. If we should add to this the value of the skim milk and calves, it would increase it materially. We started our present herd in 1892, and we feel that we have been quite successful in building up a profitable dairy herd and we give HOARD'S DAIRYMAN no small amount of credit for our success. We certainly have been greatly benefited time and again by reading it for the past few years and practicing what we have learned. JAMES H. LUTHER.

Fall Freshening Cows.—Winter Cheese.—Barns.—Silos.

Views and Inquiries of an Ohio Dairyman.

HOARD'S DAIRYMAN:—There are quite frequently statements made in the DAIRYMAN that raise a question in my mind that I would like to ask, and occasionally I have an idea that it would seem I might have to answer some one's question myself.

In your answer to M. A. C., Vt., page 152, you say: "It is much to be regretted, of course, that cows are coming fresh in milk at this season of the year." Now is that true in every use to which the milk is put? Is it true from the cheddar cheese standpoint? Perhaps if winter cheese were made Jack Frost would solve the problem of cold storage for curing. The question that confronts me is this: Is it practical to make cheese through the winter, and keep the surplus for our summer trade, when the cows would be dry? Can as good cheese be made in the winter on dry feed as on grass through the summer? We get the top price for our cheese, but the winter price is usually one or two cents better than the summer, but our customers use more cheese in the summer.

Then about silos and barns: I was recently in one of the best dairy sections of Eastern Ohio, and looked over many of their large barns. Most of these barns have been, say 36×40 or 50 feet, and they have built what they call a "straw shed" along the back side and the whole length of the old barn, and 40 or 50 feet wide; making the new barn say 50×86 ft. and making 3 gable ends, the comb of the roof making a T. The back part of the barn is in some instances self supporting, by means of large rods, and is used for storage of straw, and the basement covers the manure, and the cattle are turned loose and fed (partly) and watered and don't see out doors till spring. They are usually fed grain and silage, and milked in stanchions under the main or old barn.

The silo that appealed to me was of the lath and plaster style. I was in the second one of that kind built in that neighborhood. It seemed to me a marvel. This was the second filling. The silage was all perfect so far as I could see.

As I have not seen this silo described in the DAIRYMAN, perhaps a few words about it will not be out of place. This one was built on a cobblestone bottom, carefully placed and then cemented over. Then there was brick work, two bricks wide and three or four high, then one brick wide and two high. Upon this, two by three (2×3) studding were placed. This was lathed with 2×⅝ lath on the inside. The upper studding were 2×4, and the upper siding (perpendicular) was an inch over the lower. This silo was plastered from the top by a scaffold held in place by ropes from the roof and lowered as the work was completed. In that way there were no holes left by or punched in by taking down the scaffold. The filling should commence in a day or two, as then the mortar will not dry too rapidly and crack. This silo was 16×35, was 18 inches from the barn, and the chute was in the corner between the silo and the barn, thus avoiding the "neck."

The creamery at that place has been running ten years or more, and by the barns and silos you can tell the patrons. It is said that the farmers were driven to take up the keeping of cows, as by their old plan of farming the fields had become unproductive. Even in that prosperous dairy community there are some who have never kept cows, and it would not take a blind man to pick them out in driving over the country. C. B. B.

Greenwich, O.

We must adhere to the statement that "it is much to be regretted" that all or the greater part of the cows in a dairy herd, are bred to freshen in the spring, even when the matter is considered from the "cheddar cheese standpoint," even considering that satisfactory cheese cannot be made in winter. If cheese cannot be profitably made it is a simple matter to make butter.

But it is not safe to assume that good cheese cannot be made in winter, if cows are properly fed and cared for. The dairy schools make good cheese in winter. Fodder cheese and frosted butter are misleading terms. Neither fodder nor frost, as such, is responsible for the objectionable flavors, which too frequently accompany winter butter and cheese. Unclean stables, dirty cows, filthy milkers, improper care of milk, are the main causes of the defects which are attributed to frost and fodder.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—On the Elgin Board of Trade to-day, the Quotation Committee reported the market firm at 27½ cents.

Hinckley offered 46 tubs and Union 47, but Newman's bid of 27½ cents was refused.

The weekly output was 508,300 lbs. The New York market is firm at 28 cents.

Former prices were:

April 6, '03, 85 tubs offered, no sales, price 28½c.
April 14, '02, 80 tubs offered, firm, price 30c.
April 15, '01, 45 tubs offered, no sales, price, 20½c.
April 16, '00, 152 tubs offered, no sales, price, 18c.

The wife of James McCredie, one of the state's popular butter men, died Sunday morning at her home in Earlville, Ill. The family had lived there but two years, Mr. McCredie being engaged in the creamery business with his brother William, of Elgin. He also has interests in creameries at Palatine and Youngsdale. H. C. B.

Elgin, Ill., April 13, '03.

Handling Manure.

ED. HOARD'S DAIRYMAN:—During the short period oftime since I have been reading your paper, much has been written on the manure question, which I have carefully followed up. I notice that most of our dairy farmers insist upon hauling and spreading their manure as quick as it is being made, to get all the moisture of it in the ground.

I don't understand how a farmer can for a moment think that he is getting all the benefit of this waste product after being exposed to frost and rain during the winter and spring season, while the ground is yet frozen a number of feet below the surface

In regard to the labor saving question, my opinion is, that it really does save labor all around, and gives plenty of room in the barns and granaries.

During the first warm spell in March, I happened to come across Nadeau Bros.' farm, where they had about 20 acres of corn field covered with manure. It was spread on snow. The water was running all over, all heading for the Cedar river, just as brown as could be. Now, where did this water get this color? It was the remainder of the manure which has not been drawn out by frost.

I am not farming at present, for I have taken up cheese making. But I will give you a method of handling manure, which is being practiced on my old home farm.

They have a shed a little way from the barn in which the manure was drawn with a horse and spread. This shed is large enough so that the manure is never piled higher than about three feet. The cattle are allowed to tramp over it and generally use it for a resting place when turned out of the barn.

The manure is hauled out and spread in spring and is in the very best condition, never get even a forkful of white burned manure in the pile.

I have made up my mind to run the once co-operative factory in Nadeau which did not run for a long while, but am having a hard time to get those farmers interested in dairying. They all got this one opinion, that it don't pay to keep cows; and to pay $50 or $75 for a good bull to improve their stock, that is not to be spoken about. I have made all efforts to get them interested in reading dairy papers, but all in vain. So am quite disappointed on the French-Canadian farmers. G. J. K.

Nadeau, Mich.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Dehorning and the Show Ring.

W. R. H., Middleville, Mich., asks whether dehorning registered stock will lessen chances for winning premiums in the show ring. The ways of judges in the show ring are past finding out, and a similar statement might be applied to all other judges, not excepting those who constitute the courts of last resort in the state and nation. It is impossible to eliminate the personal equation. Jurors often disagree, and in many cases where there is formal agreement, it is reached by compromise. A dehorned cow or bull would probably suffer no disparagement in the minds of the majority of judges, but it is quite possible that now and then some judge would consider the absence of horns so serious a blemish, that he would be unable to give proper considerations to other points in which the animal might excel.

Oats or Rye for Hay.

Which is the most profitable to sow in the spring for hay, oats or rye, and at what stage should they be cut to make best hay? Would rye sown this spring make fall pasture after a crop of hay was taken off? H. B. N.

Ariel, Pa.

We have had more experience with oats than with rye for hay, and such as we have had leads us to prefer the oats. Either crop should be cut when quite green in order to make good hay, soon after coming into full head and before the grain kernels are fully formed. If one waits until the grain is in the milk stage, the sap in the stalks will be drawn upon to mature the grain. We should not expect the rye to sprout up again from the roots after haying.

When to Cut Sorghum for Silage.

I wish to fill my silo this year with sorghum. Please advise me as to the best time to cut it for ensilage. T. A. Mc.D

Clarksville, Tenn.

What say those who have had experience?

An Ontario Ration for Fresh Cows.

I would like you to formulate for me a good ration for fresh cows, with feed stuffs at the following prices: Bran, $17.00 per ton; middlings, $19.00 per ton; wheat meal, $1.15 per cwt; barley, 45c per bushel; clover hay, $8.00 per ton; brewers grains, 5c per bushel; oat chop, $1.10 per cwt.; cottonseed meal, $1.75 per cwt; corn 54c per bushel. W. F. N.

Ontario.

There is considerable lattitude for choice here. The foundation for every ration is roughage-hay, silage or stover, etc Suppose, then, we start our formula 20 lbs. of that clover hay and add say, 4 lbs. of bran and 4 lbs. of barley. When tabulated we get the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay.....	16.94	1.36	7.16	.34
4 lbs. of bran.....	3.52	.50	1.54	.12
4 lbs. barley.....	3.56	.35	2.62	.06
Total	24.02	2.21	11.22	.52

Add salt daily and this ought to give good results. Brewers grains, if always strictly fresh and of good quality, with ground corn, may be substituted for the bran and barley—say, 20 lbs. wet grains and 3 lbs. ground corn. Again, middlings might be fed in place of barley.

Objections to Stone Silos.

What are the objections, if any, to a stone circular silo? It seems to me that a well made stone silo would be the ideal silo. I'm thinking of building one 20 feet in diameter, and about 30 feet in height. Please give me your opinions of such a silo. C. McC.

Hogansburg, N. Y.

There are no valid objections to a stone silo, if properly constructed and smoothly cemented on the inside. Of course the walls must be strong and we would make a continuous opening from top to bottom 2½ feet wide for taking out the silage, rather than bother with several small openings, two to four feet apart. Reinforce the walls on either side of this opening with a substantial buttress. Also insert in the wall on either side, irons, projecting about 3 inches, threaded to receive nuts, so as to fasten firmly and hold in place pieces of 2×6 set four inches back from the inner face of the wall, to hold the movable planks, which are to be used to fill the opening as filling progresses, and are removed as silage is fed out.

Cow Peas or Soy Beans for Northern New York.

Do you think I can raise cow peas or soy beans in this locality (northern New York), and if so, which do you think would be the best to try, and would be the best to sow with corn, or by itself, for silage, and where can I purchase the seed? H. C.

Beekmantown, N. Y.

We cannot advise trying either cow peas or soy beans except in an experimental way at first. Any of the large seed firms can supply the seed.

Peas and Oats for Summer Silage.

What can you tell me about oats and peas for silage for summer feed, as I thought of sowing some to put in the silo to feed in summer before corn can be fed? What kind of peas would be best to sow, and what part to sow together, and what time to cut it best to put in silo? Could I sow anything better than oats and peas, to be put in the silo to be fed before corn can be used?

Has silage any effect on cows losing calves and in getting with calf?

I feed silage mornings and nights, and feed clover hay between times, and cut corn stover noons. J. H.

Neenah, Wis.

Oats and peas make good silage both for summer and winter. Use the small Canada pea, one and one-half bushels to the acre, and same amount of oats. Sow peas first and cover three to four inches deep. When peas are well sprouted, sow the oats. Cut when the pods are well formed, but before the peas will shell out.

Silage is not conducive to abortion, nor does it prevent cows getting with calf.

We have omitted the inquiry about the cow that "eats well and milks good, but is getting a little poorer than she was," for the reason that if anything at all is the matter with the cow, the statements given are not sufficient to indicate what it may be.

Several Wisconsin Silo Questions.

1. Would you advise anybody to plant cow peas in this northern climate, drilled in with corn for ensilage? 2. What variety do you consider the best for this purpose, also do they plant the same time as corn? 3. What length of carrier will it take to fill a silo that is seventeen feet high? 4. Would you advise putting a small door under rafter plate on silo to fill from, silo to be built on Buff Jersey's plan, 2x4 stave, or do you think it best to fill from dormer window? How many tons of silage will a silo hold that is 14 ft. in diameter and 22 ft. deep? W. P. K.

Weyauwega Wis.

1. No.
2. The Whippoorwill variety is usually recommended as being the earliest and hardiest. Where cow peas and corn are raised together, they are planted at the same time.
3. Not less than 25 feet.
4. Fill from dormer window.
5. About 57 tons.

Several Michigan Queries.

I read on page 115 of the last issue of milking through absorbent cotton. Is this expensive and where can it be obtained?

Our cows are grades, we have two Jerseys, two Holsteins and Red Polls. What bull would you advise using to gain the best results?

We retail our milk and want to raise cattle that will give 4 per cent milk or better, and also a good quantity.

We intend to build a silo this summer. Is it necessary to line the inside of a round silo with tar paper on thin matching? Some people having them near us, line them.

Can a silo be filled with a McCormick corn husker and shredder and prove satisfactory? We have an interest in one and thought we could raise the husking rolls and use it.

Alfalfa is grown but very little in our localiy. Is it easily killed when one wishes to plow it under for some other crop?

As to the manure question we haul ours on the wheat, spreading it thin, by so doing we are assured of a good seeding and also a better wheat crop.

In closing I might say that we have cement floors in our stables, cement tanks, more light and air in stables and will build a silo this summer.

We give "HOARD'S DAIRYMAN" the credit for all these improvements while there are many others which I have not mentioned. M. D. W.

Marshall, Mich.

Absorbent cotton is kept at drug stores and when sold in limited amounts is quite expensive, but when bought in quantity material price concessions would probably be made. See Mr. Gurler's letter page 210.

It is not practicable to hazard an answer to the second inquiry with all its attendent conditions in regard to quality and quantity of milk. Perhaps a Jersey from some of the heavy milking families of that breed would answer the purpose; or a Holstein from a dam that gives 4 per cent milk.

Stave silos are not lined. We have had no experience with shredded corn in a silo, but some of our eastern correspondents have reported good success.

Alfalfa is like clover in this respect.

Minnesota Silo and Stable Queries.

1. I should like to know how to build a silo, and of what kind of timber. I can build inside of barn and have it 27 feet deep and 18 across, or would you advise me to have it 16 feet across, and dig down to have it 30 feet or more deep. The cheapest material would be to buy more 2x6 for the barn I am going to build and select out the best ones, and cut the 22 in two pieces and splice the 11 feet on one 16 feet long; the timber thus selected would be Norway pine.
2. What kind of ensilage cutter would you advise me to buy and how large size?
3. Would you advise to build inside or outside of barn?
4. What kind of cow stalls would you advise me to make; or would you use stanchions for milk cows?
5. What do you think of the Bidwell cow stall; and will you give me the address to the one who has the patent right on them?
6. What kind of stanchion is best for young stock?
7. Would you tell how to build a cement floor in a barn, and what cement to use and how to do the work?
8. Is cement floor good to stand on for cattle and horses, and is it not cold to lie on?

Stewartville, Minn. SUBSCRIBER.

1. This question has been answered so fully in recent issues that it is impracticable to go over the ground anew for every inquiry that comes in. We would make the bottom of silo 4 feet lower than the feeding floor of stable, building up a stone or grout wall at least one foot above the surface of the ground.

2. We cannot undertake to decide upon the relative merits of different styles of cutters. For a silo, of the size indicated, a cutter with a throat not less than 16 inches would be none too large.

3. If there is abundance of barn room to spare, build inside.

4. There are several makes of stalls, each possessing some merit peculiar to itself, and all good, but which is best is an open question. Avoid rigid stanchions.

5. We do not know the present address of the proprietor of the Bidwell stall.

6. As above.

7. Level and firm the ground; put down a 4-inch layer of concrete, one part Portland cement to five of clean gravel, crushed rock, or sand, in sections about 4 feet square; when fairly hard, but not yet dry, cover with cement mortar, one part cement to three parts sand, three-fourths inch thick, cut in squares to correspond with the underlying concrete.

8. We do not approve cement floors for cattle, horses or swine to stand or lie on.

When to Apply Manure.

Is it good practice to haul green manure and spread it on level pasture land from time to time or would you shelter and pile same, hauling and applying in the fall or early winter just previous to ploughing the land? J. R. Z.

Gilroy, Cal.

This manure question has been so fully discussed in recent issues, that it seems unnecessary to enlarge upon it here.

Babcock Test for Cheese Factories.

Is there any way of applying the Babcock (or any similar butter fat test for milk) to milk, for the purpose of ascertaining its value for making cheese? J. R. Z.

Gilroy, Cal.

The fat in milk is a very accurate measure of its cheese making value. While it is true that 4 per cent milk will not make one-third more cheese than 3 per cent milk, it is nevertheless true that it will make better cheese, so that what is lacking in quantity is fully made up in quality. So, too, when milks of different percentages of fat are mixed in a common vat the rich milk brings up the average yield and quality of the resulting cheese, and should receive a correspondingly increased price.

In apportioning dividends or payments for milk, divide the net proceeds from cheese by the number of pounds of fat entering into its make, to ascertain the net price per pound for butter fat. Thus, if the net proceeds from cheese for any month, after deducting cost of manufacturing and marketing, should be $1,000, and there were 5,000 lbs. of butter fat in the milk for that month, each pound of fat would be entitled to receive twenty cents. If Mr. A. contributed 100 lbs. of fat, he would be paid $20; if Mr. B. supplied 250 lbs. of fat, his share in the net proceeds would be $50; and so on for other amounts and prices.

Is it Safe to rely upon Cow Peas or Soja Beans in Wisconsin?

As it is getting toward spring and time to think of planting, I should like to know if it would be safe to plant cow peas or soja beans with corn to put in the silo, and save the expense of a feed bill. I got some western bran that looks as though it had straw ground up in it; screenings also, $18.00 per ton for dirt is too much. We must raise our own protein. We can't afford to give all of our hard earned money to those western mills.

Vernon Co., Wis. J. G. R.

Cow peas and soja beans have ripened in Wisconsin under favorable conditions, but from the evidence at hand, we do not feel justified in advising any one to plant either at the present time in expectation of securing a paying return. If one could get seed grown in Wisconsin, and it grown from seed raised as far north, the chances are that the crop would mature, but until seed of that character can be had, we would not advise planting either cow peas or soja beans except in limited amount and in an experimental way. Meantime try an acre or two of alfalfa.

Pennsylvania Feeding Inquiries.

We are at present feeding bran at $22 per ton; gluten, $26; mixed, one-half each; good ensilage, good corn fodder and timothy hay. Would you add any cotton seed meal to above ration, at $30 per ton, or would you leave out the gluten at above prices and use the cotton seed meal? Milking 23 cows and shipping 55 gallons per day. During summer we have to drive the cows one mile to pasture, making two miles a day.

We feed bran only during summer, but would like to know what you think best to feed, so they will stand the trip and still milk good and keep up in good condition?

Please give a balanced ration from above feeds or add anything you think lacking, also the feed when on pasture. T. R. F.

West Newton, Pa.

For the present we suggest the following as an average daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	21
5 lbs. corn stover	2.98	.09	1.62	.04
3 lbs. bran	2.64	.38	1.16	.09
4 lbs. gluten feed	3.60	.93	2.03	.11
8 lbs. timothy hay	6.94	.22	3.47	.11
Totals	24.08	2.01	12.48	.56

When we say "average daily allowance" we mean that the feeder must exercise his judgment, founded upon daily observation of the several cows in the herd, and apportion the amount to be fed to the ability of each cow to make good use of it, giving some more and some less. See to it also that cows have salt every day and opportunity to drink clean, fresh water, without fear or favor.

Give the cows hay daily through the summer, and silage too if possible, and grain as may seem to be necessary. Bran and ground corn, equal parts, make good summer feed.

Effect of Forcing Cows for Largest Production.—Silage and Soiling for the Entire Year.

1. Will forcing a cow for a year or even less, for largest production, lessen her power of production for future years, and will her offspring be in any way affected by it; also will the offspring have the power to produce as large quantities, other features of the breeding being of first quality?

2. Why cannot a cow or herd of cows be maintained on a ration of whole corn and soy bean silage in equal parts, load for load, with dry forage in the winter, and the following series of soiling crops for summer? (List adapted from Jordan's "Feeding of Animals:") Winter rye, winter wheat, crimson clover, oats and peas, mixed grasses (perhaps), oats and peas, cow peas (or soy beans) corn, Jap millet, cow peas, corn, soy beans, Jap millet, corn, barley and peas. If alfalfa can

"ADVERTISEMENT."

DON'T YOU THINK

It Worth a Postal to Get Well.

When you write that postal, I will gladly send my help.

I will mail you an order—good at any drug store—for six bottles Dr. Shoop's Restorative. You may take it a month on trial. If it succeeds, the cost is $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I do that for every sick one who writes me, and I have for twelve years. I have found that the sick are honest, and I have proved that I can cure nearly all.

Only one patient in each forty decides that the test has failed. The others pay gladly—pay because they are cured.

There are 39 chances in 40 that I can cure you, and I alone am the loser if I can't. Let me try.

I have spent a lifetime in learning how to strengthen weak inside nerves. My Restorative brings back that power which alone operates the vital organs. I treat a weak organ as I would a weak engine, by giving it the power to act. My way always succeeds, save when a cause like cancer makes a cure impossible. And most of these chronic diseases cannot be cured without it.

You'll know this when you read my book.

Simply state which book you want, and address Dr. Shoop, Box 934, Racine, Wis.

Book No. 1 on Dyspepsia.
Book No. 2 on the Heart.
Book No. 3 on the Kidneys.
Book No. 4 for Women.
Book No. 5 for Men (sealed)
Book No. 6 on Rheumatis

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

A GREAT COMBINATION!

GOOD COWS AND A U.S. SEPARATOR FILL THE FARMER'S POCKETS WITH MONEY!

The U. S. Separator gets all the cream from the milk,
The cream makes the butter,
The skim-milk makes the calf,
All bring in the cash.

raised there is no better feed for soiling, and no need of any other. M. B. B.

Haddonfield, N. J.

It is seldom that cows forced to extreme production for long periods are subsequently heard from as phenomenal producers. Whether this is wholly due to impaired power, or whether some, or all, of it results from the owner's disposition to rest upon the victories already won, is, perhaps, a mixed question, but analogies would indicate that the forcing process may be carried so far as to impair future usefulness. There are not facts enough at hand to justify the expression of opinion as to effects upon offspring.

2. Unquestionably cows can be "maintained" on silage and soiling crops as set forth, but probably not to best profit without the additfon of some grain. A cow of pronounced dairy temperament cannot eat and digest enough roughage to furnish sufficient raw material from which to elaborate milk up to her capacity. To expect a milch cow to do her best in the way of total or profitable production on a daily diet of roughage alone would be, in a way, like attempting to haul a train of cars with nothing but straw for fuel in the locomotive.

Why Face Cows Outward in Stable.

ED. HOARD'S DAIRYMAN:—I note in the DAIRYMAN of April 3rd, page 181 a communication from H. L. S. of Westerville, O., regarding building a cow barn. Your suggestions to him about building the barn longer, and having two rows of cattle facing outward is commendable, particularly if he aims at labor saving and cleanliness, and in these times of high priced labor these items must be taken into account. Would suggest to H. L. S. that he put in a manure carrier behind his cattle so as to handle the manure to best advantage and to put the same on the land daily, thus saving labor in handling, besides putting the fertilizer where it is most needed and at the time when the most benefits may be derived from it.

Why do you advise facing the cows outward? What advantage has this position over facing them toward a central feeding alley of good width, say not less than 10 ft, with manure carrier behind the cattle? I am greatly interested in the subject of stabling just at present, both for dairy and beef cattle. You must have some well considered reason for placing the cattle as you suggest and I hope you will give your readers the benefit of them. Where cattle are confined to the stables all the time they are usually fed three times a day while the cleaning is usually not done oftener than twice a day. Query, which way shall we face the cattle in order to save the most labor and at the same time keeping in mind the health and comfort of the cattle. I am free to say that most of the dairy barns, built along modern lines, have the cattle facing inward toward the main feeding alley. Will you kindly give us light on this question. E. F. B.

St. Paul, Minn.

We do not consider the matter of facing cows either one way or the other of sufficient importance to call for extended argument.. Personally we prefer to face them outward, just as others prefer to have them face a central feeding alley. We fancy our way is more economical of room and of labor, and gives one a better command of the whole situation. It is also more sanitary, we believe, as it puts the cows further apart from nose to nose.

The manure carrier and spreader are all right, but in the absence of a carrier when cows face outward, a wagon or sled can be drawn through and the droppings gathered.

Local Dairy Meetings in Ohio.

The Ohio Dairymen's Association is prepared to hold a few local dairy meetings this summer and to furnish experts at request of owners of cheese factories and creameries to aid butter and cheese makers to overcome faults in their product. The amount of money available for these purposes is limited, and the co-operation of communities, where meetings are held, and of owners of factories, in meeting expenses, is imperative. The most the association can do is to pay the instructors and lecturers for the time spent.

Persons or communities wishing assistance in their lines should correspond with the Secretary, D. A. Crowner, West Jefferson, Ohio.

COOKING CONTEST

Right in the Family Kitchens.

The ladies have a champion interested in the betterment of family cooks.

$7,500.00 in cash has been donated by C. W. Post, Chairman of the Postum Cereal Co., Ltd., to be distributed between now and July next in 735 cash prizes to stimulate family cooks to better service.

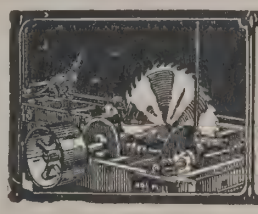
Less burned and greasy meat, and potatoes, less soggy biscuits, cake, etc., and better coffee, Postum and tea is the motto.

The girls are to compete in the preparation of good, every day dishes and in general cookery. Probably Grape-Nuts and Postum Coffee will come in for some attention incidentally, but the tests will be conducted under the daily direction of the housewife and 735 cooks will win varying cash prizes from $200.00 down to $5.00; no one is required to pay anything whatever to enter this contest and each winner will receive a large certificate or diploma with the big Postum seal in gilt, a badge of distinctfon much to be sought after. Particulars can be had by addressing Cookery Dept. No. 388, of Postum Cereal Co., Ltd., Battle Creek, Mich.

SAVE 20 CENTS PER SHEEP on every sheep you shear with

STEWART'S PATENT

SHEEP SHEARING MACHINE



The day of the old fashioned hand shears is past. No owner of 10 sheep or more can afford to shear by hand, even though the work be done for nothing. Don't butcher your sheep. Shear with this machine and get **ONE POUND WOOL EXTRA PER HEAD.** It will more than cover the cost of shearing. Send today for valuable book, "Hints on Shearing." It is free and will save you money.

Dehorning Heifer Calves with Caustic Potash.

ED. HOARD'S DAIRYMAN:—I notice an article in issue of DAIRYMAN March 27, from J. H. W., Casky, Ky., asking when to dehorn his heifers. Will give you my experience: About six years ago I had about 50 head dehorned with clippers. Since that time have dehorned my calves when from two to eight days old. I do it as follows: Get a can of potash or concentrated lye; put it in a glass fruit jar or other air tight place, so it will not evaporate. When the calf is from one to eight days old, put two or three pieces of potash the size of a large bean in a cup and add a teaspoonful of water, not enough to dissolve quite all of the potash, so I know it is strong as can be; let it stand an hour, and stir it once or twice; then with a small swab wet the horn buttons well, and the calf will have no horns and has not been injured.

Care must be exercised not to put the potash on the calf's ear or in his eye or on your fingers, for it will burn where it hits. My herd consists on an average of 100 head all dehorned in this way. It costs nothing, does no damage, and is a success in every way; and I am fully satisfied is the best way to dehorn cattle;

I am one of your short-time subscribers, and am much pleased with the paper; shall continue with you; am interested in the results obtained by different dairymen from their herds. They should open some people's eyes.

As I breed fine dairy stock for sale, the number of cows kept changes quite often. But as near as I can figure, it costs me $36, on an average, to keep a cow a year; and taking my creamery returns for the past year and allowing a fair amount for milk, cream and butter used, and 15 cents per 100 for skim milk fed to calves and pigs, am getting $1.50 for each $1.00 in feed. My herd is fast improving by use of the best bulls I can get, and raising the best heifer calves. So my courage is good.

West Burke, Vt. B. H. M.

DAIRY MARKETS.

ELGIN, Ill., April 13—Butter—Dropped 1c a pound on the Board of Trade today, selling at 27½c. Sales for the week in this district were 508,360 pounds.

BALTIMORE MARKET.

BALTIMORE Apr. 9—Butter—So far this week there has no preceptible increase in the general receipts. Extras continue in moderate supply, but are fully equal to the requirements; the price has restricted the demand to some extent. Firsts and good seconds have been meeting with prompt sale. There has been considerable inquiry for fancy held creamery, both from local and out of-town buyers. Imitation creamery—All choice to fancy makes are in quick demand while under grades favor the buyer. Choice fresh ladles are in very ligh receipt and find a ready outlet at quotationst Rolls continue in fair supply; all sweet stock arriving in good condition meets prompt sale. Store-packed has been in more liberal receipt; the demand for all desirable offerings is equal to the supply. Blocks and prints—There is a continued scarcity of choice to fancy stock, while the demand is brisk. The market rules steady and firm on all stock suitable for table purposes.

Creamery Separator, extras, 29½@30c; firsts, 28@29c; seconds, 24@26c. June Creamery, extras, 24c@25; firsts, 22@23c; seconds, 19@21c; Imitation Creamery, extras, 21@22c; firsts, 19@20c; sec-

$500 REWARD! FOR WOMEN

WHO CANNOT BE CURED.

Backed up by over a third of a century of remarkable and uniform cures, a record such as no other remedy for the diseases and weaknesses peculiar to women ever attained, the proprietors and makers of Dr. Pierce's Favorite Prescription now feel fully warranted in offering to pay $500 in legal money of the United States, for any case of Leucorrhea, Female Weakness, Prolapsus, or Falling of Womb which they can not cure. All they ask is a fair and reasonable trial of their means of cure.

Their financial responsibility is well known to every newspaper publisher and druggist in the United States, with most of whom they have done business for over a third of a century. From this fact it will readily be seen how utterly foolish it would be for them to make the above unprecedented and remarkable offer if they were not basing their offer on curative means having an unparalleled record. No other medicine than Dr. Pierce's Favorite Prescription could possibly "win out," as the saying goes, on such a proposition. But they know whereof they speak. They have the most remarkable record of cures made by this world-famed remedy ever placed to the credit of any preparation especially designed for the cure of woman's peculiar ailments. This wonderful remedy, therefore, stands absolutely alone as the only one possessed of such remarkable curative properties as would warrant its makers in publishing such a marvelous offer as is above made in the utmost good faith.

"I want to tell you of the great improvement in my health since taking your 'Favorite Prescription,'" says Mrs. H. S. Jones, of Forest, N. C. "When I began its use I was a physical wreck and had despaired of ever having any health again. Could not sit up all day. I noted a great improvement before the first bottle was used. Was suffering with almost every pain that a woman is subject to; had inflammation of ovaries, painful and suppressed periods, and other symptoms of female disease. After taking six bottles of 'Favorite Prescription,' I felt like a new person. Can ride horseback and take all kinds of exercise and not feel tired."

If you are led to the purchase of "Favorite Prescription" because of its remarkable cures, do not accept a substitute which has none of these cures to its credit.

If you are looking for a perfect laxative try Dr. Pierce's Pleasant Pellets.

301 Exchange Place. G. M. LAMB & BRO.

NEW YORK MARKET.

NEW YORK, April 14th.—Butter—Receipts for the week, 37,001 packages. Exports for the week, 1,392 packages.

Receipts are full for the time of the year, but trade has been steady and strong and all kinds of table butter were quick taken at full prices and the market closes firm on all top qualities. Extra fresh creamery sold at 29c, with occesional sales a fraction higher, for very high scoring goods. Under grades were in demand at prices ranging from 25 to 28c. New dairy make comes sparingly, a few selections of fancy Delaware tubs sold at 27 to 28c and entire lots 20 to 25c. Finest June make creamery found plenty of buyers, mostly from eastern trade at 25 to 26c, while good quality was taken at 22 to 24c. and poor stock at 16 to 20c. At the close there is little fine Refrigerator Creamery left and trade that has been using this style goods, will have to shift to fresh creameries or renovated butter before the month is out, and fair, steady prices may continue a few weeks longer. Ladles and low grades Western are having more demand at prices ranging from 13 to 18c. Finest renovated growing less plentiful, and in good demand. Other grades plentiful and neglected. We quote:

Creamery, fresh, extra, 29c; medium, 26@28c; poor, 20@25c. Creamery, June, extra, 24@ 26c; medium, 21@23c; poor, 15@20c. Dairy, extra, 27@ 28c; medium, 22@25c; poor, 15@20c. Ladle, extra 20@22c; medium, 16@18c; poor, 13@15c. Renovated, extra, 20c; medium, 18@19c; poor, 13@17c.

Cheese—Receipts for the week, 11,262 boxes. Exports for the week, 2,700 boxes.

Market is dull, only small peddling business doing and most sales are at less price than quotations. Skimmed cheese, unless very fine, are dull and lower. We quote:

Full cream, extra, 14½@15c; medium, 13@14c; poor, 10@12½c.

Eggs—Receipts for the week, 145,864 cases.

Speculation in storage packed eggs is general the country over, and are quoted and salable at about ½c doz. higher than average packings. Large lines are changing hands at 16c. Home trade is taking liberally at 15 to 15½c for best Northern and Western, and 13 to 15c for southern and ordinary marks. DAVID W. LEWIS & CO.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—In the Virden District, Manitoba, two adjoining 320 acre farms; soil, black prairie mold. No. 1 has 270 acres cultivated, bank barn 40x70 with geared windmill and waterworks in stable; 5000 bushel granary with elevator; large tool house, and 12 room dwelling, wind breaks, shade trees, 4 miles fencing; price $6,500. No. 2 has 260 acres cultivated, balance fenced pasture and hay; stable for 40 head; 5000 bushel granary, tool house, and 5 room dwelling; price $3,500. For terms and particulars address ROBERT TURNBELL, Two Creeks, Manitoba. 10-2

Cheesemaker Wanted—Experienced, capable and industrious. Address, for particulars, P. E. CRANSTON, Sabin, Wis. 10-3

Guernseys For Sale—Four choice grade heifers 2½ years old, to calve in May and June, and one grade bull 2 years old. SWITHIN SHORTTIDGE, Landenburg, Pa. 9-2

Cheesemaker wants to change position by May 1st. 6 years experience, married, sober and industrious. Can make butter. References. State wages in first letter. Address Postoffice Box 31, Eastman, Wis. 9-2

For Sale—Complete city dairy (no cows) and ice cream plant in thriving southern city. Output 500 gallons milk daily at profit of 9 and 10 cents. Daily expense less than $30.00. Price $7,000. Can furnish experienced dairyman and ice cream maker with $2,000 cash to invest in the business as a partner, or will sell as a whole. Best reason for sulling. Address "APRIL", care of Hoard's Dairyman, Fort Atkinson, Wis. 8-tf

Wanted—A man and wife to work on farm by the year. Good place for the right party. Address CHAS. STEFFIN, Corliss, Racine Co., Wis.

Wanted—Position as butter maker; 9 years experience. Can furnish best of reference from last place. Sober, industrious, good machinist. State wages in first letter. J. E. SWARZ, Reedsburg, Wis.

For Sale—One "Baby" De Laval separator, good as new. Write quick and get this bargain. JAMES M. ROGERS, Elsberry, Mo.

Wanted at Once—A first-class milker and good creamery man and butter maker. Wages $40.00 per month and board, if single, or $40.00 per month and nice cottage, garden spot, etc., if married. Address THE J. E. CRIDER CREAMERY CO., Fredonia, Ky.

Wanted—An experienced cheese maker to take charge of factory by May 1st. Must be sober and reliable. Will pay good wages. Address J. H. SMITH, Stark, Wis.

Wanted--Man who can furnish his own help to run 60-cow Jersey dairy (no farming). Contract one year. State experience. For details address J. D. ROSZELL, 223 So. Madison, Peoria, Ill. 10-2

For Sale—No. 7 W. S. Separator, capacity 350 lbs. with both hand and power attachments. Has been in use but three months. THOS. FASSETT & SONS, Sylmor, Md.

Experienced butter and cheese maker, graduate of Wis. Dairy School, wishes to change position. Have handled gasoline engines and ammonia machines. Good references. Prefer to go south, or to the Pacific coast. Address M. 66, care Hoard's Dairyman. 8-3

Farm Manager, capable and experienced in dairy farm work is desirous of securing a position. 39 years old and have had 20 years experience in the work. Have successfully managed registered herds of dairy cattle and am familiar with modern dairy machinery and methods. Well educated. Address R. E. N., care Hoard's Dairyman. 8-4

For Sale—A two horse Heebner's level tread power, on trucks, in good condition for $45. Address ALFRED MIRITZ, Kewaskum, Wis. 7-4

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

Guernseys For Sale—Six cows and seven heifers. All registered. Send for circulars. EDW. SHARPLES, Landenberg Pa. 7-tf

For Sale—1 DeLaval cream separator, Alpha No. 1. WEXFORD EXCHANGE, LTD., Wexford, Pa. 6-tf

For Sale—One fine registered yearling Guernsey bull. Address S. L. DIETZ, Hyde's P. O., Md. 8-4

For Sale—To settle estate, dairy farm and milk route, one and one-half miles from Mauston, county seat of Juneau County, Wis. 35 cows, 200 or 280 acres as desired, with fixtures and stock. Basement barn. There is good tobacco land on this farm. Enquire of B. N. SOUTHER, Mauston, Wis. Box 336. 9-5

For Sale—One Reid separator, capacity 2000 lbs. per hour, good as new. Also gang cheese presses, never been used, curd mill and vats. ALEXANDRIA CREAMERY CO., Alexandria, Pa. 9-3

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

Wanted—Situation by expert retail dairy manager. All branches of the business thoroughly understood. Have references second to none. Address J. O. G., care Hoard's Dairyman. 8-tf

Two choice young Guernsey bulls for sale. MRS A. W. LEHMANN, Neosha, Dodge Co., Wis.

For Sale—10 h. p. Leffel boiler with Moo e steam pump, fine condition. A bargain. Add ess BOX 54, Hastings, Ill. 10-2

Half Rates to New Orleans, La.—Via the North-Western Line. Excursion tickets will be sold at one fare for round trip May 1, 2, 3 and 4, limited for return by special extension until May 30, inclusive, on account of Annual Meeting American Medical Association. Apply to agents Chicago & North-Western R'y. 10-3

Very Low Rates to California and Return—Via the North-Western Line. First-class round-trip tickets on sale May 3d and 12th to 18th, to Los Angeles and San Francisco. Favorable limits and stop over privileges and choice of routes. The overland limited, most luxurious train in the world, leaves Chicago daily 8:00 p. m. Less than three days en route. Drawing room and compartment sleeping cars, observation cars, dining cars, buffet-library cars, (barber and bath) electric lighted throughout. Three trains a day from Chicago to the coast through without change. Daily and personally conducted tourist car excursions to California, Washington or Oregon. For particulars apply to ticket agents Chicago & North-Western R'y. 8-7

Very Low Rates to Dedication Ceremonies of Louisiana Purchase Exposition, St. Louis, Mo.—Via the North-Western Line. Excursion tickets will be sold for the above occasion April 29, 30 and May 1, and on account of Good Roads Convention on April 26 and 27, all with return limit until May 4, inclusive. Apply to agents Chicago & North-Western R'y. 9-4

To Colorado in 1903—The passenger department of the Chicago & North-Western Railway has issued a very interesting folder, giving information as to reduced rates and sleeping car service, with a short description of the various points of interest in Colorado usually visited by tourists, these excursion rates applying on account of the Christian Endeavor meeting to be held at Denver, July 9th to 13th. Send 2-cent stamp for copy, to W. B. KNISKERN, Passenger Traffic Manager, Chicago. 9-6

Notes from New York.

The Skim Milk Product.—Which Breed.

ED. HOARD'S DAIRYMAN: — It is an established rule at our corner grocery, that if a man tells a story twice alike, it removes all suspicion of exaggeration or fishiness, and establishes its truthfulness. And no one dares thereafter to raise a doubt, for fear of expulsion from the chairs and be obliged to stand up until he is voted back into grace.

This question of utilizing skim milk, suggested itself to me, and became my study from the first day we used a separator. At the time we purchased the separator, we had all the calves from our cows and were feeding them the milk right from the cows, intending to sell them as veals when they would weigh 140 lbs. or better.

How to still fatten as veals, and at the same time skim the cream off, became the all important question and the discouragements and failures connected with it, well nigh became unbearable at times, and if it had not been for a good butter market and good butter cows I should probably have gone back into the cheese factory. That was seven years ago, before I ever heard of HOARD'S DAIRYMAN or the station bulletins, making the question more difficult but none the less pertinent. We finally began making a jelly of linseed oil meal and giving a little in each calf's mess, increasing the quantity as the calf grew older. We put our calves in pens where they can be fed hay and sometimes we put in smooth bottomed troughs and let them lick dry corn meal after they get a little age. The one great trouble with separator milk is the liability of calves to scour caused by overfeeding. Too much care cannot be given in raising or fattening calves to have the milk at the right temperature, and where it comes from the creamery, it is liable to be off for the night feed. One can not feed sweet milk in the morning and sour at night with any success, and the temperature of the milk right from the separator during cold weather is generally a few degrees too cold and should be warmed.

How many times buckets or old pails that have not seen a brush or water for weeks at a time, are used to feed the calves in. I recently went with my father to settle with the tenant on his farm and they have a calf there about two weeks old that they were feeding from an old wooden pail. I thought that that was the case and I asked the man if they ever washed the pail and he said, "no, what's the use, the calf licks it out clean." Whether the calves wash the other milk utensils I didn't inquire. Last spring I received a good many letters from the readers of the DAIRYMAN about my method of feeding veals skim milk, but I have never heard a word from any of them about what success they have, or whether they ever tried it or not.

No, Mr. Parsons, there are no secrets concerning any of my methods, and I am ever ready to answer frankly any questions concerning them, their successes or their failures, and that free gratis. We know to a cent the receipts from every department of our farm, the poultry, the dairy and the hay and grain. The vegetables, the apples and everything is strictly accounted for; the quantity, the date and the price it brought. How else could a farmer do business successfully?

There seems to be a little misunderstanding between the farmers, the readers of the DAIRYMAN, as to what breed of dairy cows Mrs. R. R. B. really wants, but still just exactly which kind does not yet seem to be exactly settled by the disputants. There is always a little choice between what we own and what our neighbor owns. Ours is a little the best because it is ours, not really because it is a Jersey, or Guernsey, or a Short-horn, or Holstein, but just simply because we own it. Now, if I was going to advise Mrs. R. R. B. which breed, I should like to know something of her conditions and the methods under which she expects to keep her cows. If she is able to furnish Holstein conditions and cares to devote the time or expend the labor upon them to make them give that 80 lbs. of milk per day, why, they are the breed she wants. But if Mr. McKay ever really produced 80 lbs. per cow, why does he not tell Mrs. R. R. B. what she must do to get that 80 lbs., so that she may know what to expect and not be deceived. I will venture to say that nine-tenths of the big records that are made under official test, would not nor could not be carried over any great length of time. Again, these great records are misleading to the great mass of would-be purchasers, no matter what breed they come from. Why, I have got cattle in my barn that their pedigrees show red ink records that would make Mr. McKay shudder, and yet I never get nor expect to get such results, although when it comes to returns at the end of the year we don't have to go very far back to sit down.

I am not an advocate of any breed in particular, but will have good cows or none and I don't care whether they are black and white or red and white, whether they have the triple wedge shape or udders that conform to laid down rigid rules so long as they give a good mess of milk and make a good quantity of butter. We want cows that with a minimum amount of labor will also give us good returns. While we expect to work in the dairy we also have other things about the farm that will not allow us to milk our cows at noon and our hired men object to a cow at all. So what are you going to do in that case?

It was just this one thing that has driven the dairy farmers more and more into hay and grain in the east. Again, if Mr. Fred E. Harriman wishes to advise the lady, why does he not give us his actual experience instead of quoting us records that were made in some obscure corner, so that the rest of us can get back at him, not "mere opinions or assertions unless they are backed by the evidence," that's what we want. Now take care that some picked up dairy may not pop up somewhere and cast a shadow longer and darker than yours. What Mrs. R. R. B. wants is a dairy of cows adapted to the surrounding conditions and the purpose she expects to make use of them. If she just wants cattle to eat up a lot of coarse fodder why the Holsteins are as good as any kind and better as Mr. McKay says they "will come up to their feed three times a day without coaxing." They are like the landlord's hog that Charley Jennings used to tell about. He had a mammoth hog that he wanted Mr. Jennings to look at and a couple years later he was asked to see the same hog and

"ADVERTISEMENT"

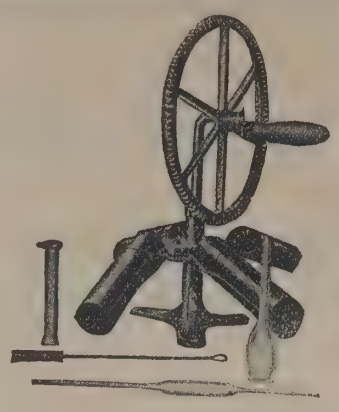
QUIT AND EAT.

Some Coffee Tales.

Show a woman an easy, comfortable and healthful way to improve her complexion and she is naturally interested.

Coffee is the one greatest enemy of fair women, for in the most of cases it directly affects the stomach producing slight, and sometimes great congestion of the liver and therefore causing the bile to be absorbed into the system instead of going its natural way. The result is a sallow, muddy skin and a train of diseases of the different organs of the body which, in all too many cases, develop into chronic diseases.

A lady speaking of how coffee affected her says: "I was very fond of coffee but while drinking it was under the care of the doctor most of the time for liver trouble, and was compelled to take blue mass a great deal of the time. My complexion was bad and I had a pain in my side steadily, probably in the liver.



"When I concluded to quit coffee and take Postum Food Coffee I had it made carefully and from the very first cup we liked the taste of it better than any of the old coffee.

"In a short time the pain left my side and my friends began to comment on the change in my complexion and general looks. I have never seen anything equal to the good I got from making this change.

"A young lawyer in Philadelphia named ——, whose life was almost a burden from indigestion and its train of evils, quit coffee some months ago and began on Postum Food Coffee. He quickly recovered and is now well, strong and cheerful and naturally loud in his praises of Postum.

"Another friend, an old gentleman of seventy, named ——, who for years suffered all one could suffer and live, from dyspepsia, and who sometimes for weeks could eat no bread or solid food, only a little weak gruel or milk, quit coffee upon my recommendation and took up Postum. He began to get better at once. Now he can eat rich pastry or whatever he likes and is perfectly well."

Names given by Postum Co., Battle Creek, Mich.

ROBBER COWS.

Some cows rob the owner of the feed they eat, and of the profit of the rest of the herd. They have little or no butter fat in their milk. Find them out and send them to the block.

THE

"Sweepstakes"

Babcock Milk Tester

Will do it. Runs on ball bearings, 2 and 4-Bottle sizes with necessary glassware. Strong, convenient.

WRINGING WET Clothes dry is the reason for using any wringer. Saving clothes, buttons and money is the reason for using **Horse-Shoe Brand Wringers.** They are made with rolls of the finest Para Rubber. Every wringer is warranted. **THE AMERICAN WRINGER CO., 99 Chambers Street, New York.**

the landlord when asked why he did not kill that hog and buy another said, "why isn't that hog just as good to eat my swill as any?" He just kept the hog to get rid of his swill and have a big nice hog at the same time.

It is my opinion and experience that more depends on the man behind the cow than on the particular breed she belongs to. I would want to know beyond a shadow of doubt that there was performance behind pedigree, as I have seen good sires and dams bring forth some poor dairy stock. I have been greatly disappointed in some of the stock that came from animals that I personally knew were grand performers at the pail.

The man behind the cow, from the calf up, is the most important factor in dairyology, and the war of the breeds stands about even up so far with each claiming their superiority. JAS. M. PLATO.

Plessis, N. Y.

Alfalfa in Vermont.

ED. HOARD'S DAIRYMAN:—Have been reading every scrap of information that has been printed, or at least all that has come to my notice, for a long time in HOARD'S DAIRYMAN relative to alfalfa, its uses for silo and otherwise. I have not really made up my mind, or have I really got the information from what I have read as to whether it could be grown successfully in Northern Vermont or not. So I come to you for information. I do not know of any one in Vermont that is growing alfalfa, but it strikes me that if it can be grown successfully in Wisconsin and Minnesota, we can also grow it here. From the information that I get as to its feeding value, it would be a great help to the pocket book of the eastern farmer in the way of saving the wheat bran bills, providing we can grow it equally as well as the western farmers.

If there are any Vermont farmers growing alfalfa that read HOARD'S DAIRYMAN, I, for one, would be pleased to hear from them through the DAIRYMAN as to how long they have been growing it, as to how they prepare the ground, the sort of soil it does best on and also where best to get seed for this northern climate. I, for one, am going to try an acre, but want to get all the information as to getting it started and the proper seed so that I wont fail, due to not doing the work properly. G. R. R.

Sheldon Junction, Vt.

We are unable to make any definite statement as to the probable success of alfalfa in Vermont, but judging from its success in Wisconsin, where the winters are much more severe, and the summers hotter and drier, we see no reason why alfalfa cannot be grown successfully in Vermont.

Alfalfa seems to have been uniformly successful all over the United States where the necessary selection and preparation of the land has been made. We should advise a trial on a small scale, with thorough preparation of the land, before going into alfalfa extensively.

Do Jerseys Have Small, Weak Calves?

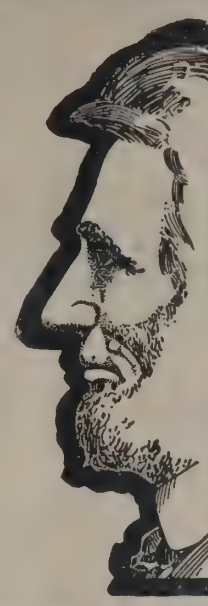
ED. HOARD'S DAIRYMAN:—I would like to hear Dr. Kitchen discuss the reason why Jerseys have such small weak calves? If you could induce him to do so, I believe it would help many Jersey dairymen. I wish I could tell you how much I have been benefited by reading your paper. In fact, it has made the difference between success and failure with me, for which, I most heartily thank you. L. R. P.

Plattsburg, N. Y.

In reply to L. R. P., all Jerseys do not have small weak calves. Most of Robinswood Farm calves are strong and vigorous. Occasionally one of our in-bred youngsters, will not be up to the mark. Among the many causes of weakness, we may mention, too long lactation, insufficient feed, and especially too little protein; indigestible feed, neglect and exposure, bad hygenic conditions, such as impure air and too little exercise. But the broad fact remains that all good cows that have a good ancestry having ability to make udder products ecconomically have rather small calves, being themselves moderate sized or small cows or have family tendency to small size, for the more the digested nutrients go to the udder, the less there will be for the calf in the uterus. Feeding the bull a broad ration, is apt to result in weak progeny, also over-use of the bull.

The devitalizing effects of over production development in the special-purpose cow are so apparent to the observer, that the time cannot be far off when there will be a general recognition of the fact that a decided limit must be made to productiveness, to get a satisfactory progeny. In the meantime some of my brother Jersey breeders consider me a very bad kill-business for holding such views; and are upholding a production of 6000 lbs. of rich milk, as an element of superiority in a two-year-old heifer. Pre-supposing that a two-year-old heifer is a small sized animal, I should like to see any such producer that has been proved to be a good breeder of strong, large calves.

There are good and poor strains of Jerseys. I have a neighbor whose calves mostly die. Mine do not. I have other blood and treat them differently. All good cows must be kept decently warm. The dual-purpose fellow may have the consolation of knowing that at best his calves are larger and stronger, than those of the special-purpose class. The fellow with an empty milk pail and a minus pocket-book, needs some consolation. J. M. W. KITCHEN, M. D.



N. H.

Alfalfa a Medicine.

With every season's new additions to the growers of alfalfa come new accounts of the marvelous values of the plant. Here is a contribution to alfalfa lore from W. S. McAuley of Americus, Lyon Co., Kan.

"A few years ago, said he, farmers were almost afraid to raise hogs on account of the prevalence of cholera. Once that disease got a start in a herd it generally succeeded in practically destroying it. Not only the aged stock, but the pigs as well were affected. Hog cholera remedies were sometimes used to good advantage, then again they proved to be ineffectual in stopping the ravages of the plague. Since the farmers have taken to growing alfalfa extensively as a field forage plant for hogs, however, the situation is changed. Now hog cholera in our part of the state is rare and the loss of swine by disease has been reduced by more than 50 per cent. Farmers everywhere attribute the change to the wonderful plant, alfalfa, and I sincerely believe that is what worked the transformation.

"The difference in the health of hogs that have been pastured on alfalfa and those that have been kept in feed-lots and fed grain and dry feeds, is pronounced, and particularly so with regard to young pigs. Sucklings that have alfalfa-fed mothers, are far more rugged and healthy than are those that trace their ancestral dam to the pig sty. Sows that forage on alfalfa, raise lusty, hearty pigs that seldom fall victims to cholera, while mothers that are kept on other feeds and not permitted the freedom of the alfalfa fields, are generally inclined to be sickly. Kansas has made great strides in growing alfalfa the last two or three years and I think you will find those sections of the state that raise the greatest quantities of that plant are turning out the cleanest hogs and complain less of the prevalence of cholera."

Since Lincoln's Time,

more than 7,000,000 Jas. Boss Stiffened Gold Watch Cases have been sold. Many of the first ones are still giving satisfactory service, proving that the Jas. Boss Case will outwear the guarantee of 25 years. These cases are recognized as the standard by all jewelers, because they know from personal observation that they will perform as guaranteed and are the most serviceable of all watch cases.

JAS. BOSS

Stiffened GOLD Watch Cases

are made of two layers of solid gold with a layer of stiffening metal between, all welded together into one solid sheet. The gold permits of beautiful ornamentation. The stiffening metal gives strength. United they form the best watch case it is possible to make. Insist on having a Jas. Boss Case. You will know it by this trademark

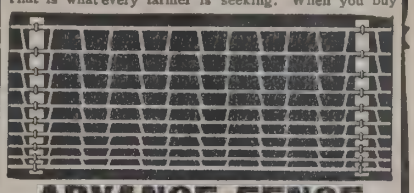
A FENCE SECURE



from within and without. It keeps its form in heat and cold. It does not unravel for all wires are continuous. Extra strong at top and bottom. A fence to meet all needs, handsome, strong, permanent, easily and quickly built. 18 to 64 inch heights. It is suited to every farm want—all kinds of stock. Catalogue free.

CUYAHOGA WIRE & FENCE CO., Dept. D, Cuyahoga Falls, O.

We Make Honest Fence

AT A REASONABLE PRICE.

That is what every farmer is seeking. When you buy

ADVANCE FENCE

you get a good fence at the price of a poor one. The hand fence machine can't compete in price and quality.

WE SELL DIRECT TO THE FARMER AT WHOLESALE.

That saves you the dealer's profit. It's all interwoven, no loose ends to unravel, ruining fence. Cross wires can't slip. Our prices are as low as can be made for a good fence. Your name and address on a postal card will bring circulars and special prices. Write at once.

ADVANCE FENCE CO., 126 R ST., PEORIA, ILL.

BB FENCE We'll tell you the cheapest and best way to build it. Of any kind of wire, for any requirement, with cheap labor, no machine and we'll tell you how to fix your old fences too. Write B. B. FENCE CO., 1345 Clark St. RACINE, WIS

BROWN

16 to 35 Cents Per Rod.

Heaviest, strongest, most durable fence made. All wires extra large. We sell to Farmers at Wholesale Prices. Coiled Spring, Barb and Soft Galvanized Wire. WRITE FOR CATALOGUE

The Brown Fence & Wire Co. 292 Base St., Cleveland, O.

DR. HAYES, Buffalo, N. Y.

More About Dr. Pearson's Method of Tuberculosis Inoculation.

Great interest has been felt by owners of dairy cattle, especially since the announcement by Dr. Leonard Pearson, of Pennsylvania, that he had successfully rendered cattle immune to tuberculosis by a system of inoculation.

The *Veterinary Magazine* recounts the following fact in further support of the theory, taken from experiments made by Dr. S. H. Gilliland who is associated with Dr. Pearson:

"To prove the efficacy of the treatment as a preventive of tuberculosis, Dr. Pearson secured four healthy young cattle sometime last March. Two of them were vaccinated and in July all four were inoculated by injecting into their windpipes a quantity of virulent tubercle bacilli culture. Each animal then received the same treatment until recently, when they were all killed.

"The two animals that had been vaccinated were found to be perfectly sound at the time of their death. There was not a trace of tubercular infection. On the other hand, the two unvaccinated animals were extensively tuberculous, showing alterations of the disease in the windpipes, lungs, throat and intestinal glands.

"Having proved that cattle may be made immune from the greatest scourge by which they are afflicted, Dr. Pearson states that he intends devoting his energies to perfecting the method used in vaccination. In conjunction with the State Live Stock Sanitary Board, of which he is the secretary, he intends continuing the experiments until the shortest and simplest practical method has been found.

How long the immunity will last and what the ultimate effect on the animals will be has not yet been discovered, but the few experiments already performed lead Dr. Pearson to believe that no unfavorable conditions will result."

It Means Something

to you to have harness that are right in make and material. It means as much with respect to the wagon or any other vehicle you buy. Don't ever question that it pays to buy value. Looking for the cheapest gets you the shoddiest, and you are practicing the poorest kind of economy.

Studebaker
Vehicles and Harness

have quality and give service—the highest and the best. Not once, but everywhere and always. The name is an unfailing guarantee. Their honorable record is now running into the second half century. The first fifty years never found them wanting. Endless variety, all styles, one quality. Local Studebaker dealers will show them. We will mail you descriptive catalogue on request.

Studebaker Bros. Mfg. Co.,
SOUTH BEND, IND.

AUCTION SALE OF

70 Holstein-Friesian Cattle

from the herd of

ARTHUR N. McGEOCH

Sale to be held at

MILWAUKEE, WIS.,

Wednesday, May 6, '03

Sale to be held at McGeoch Farm, "Redbrae" opposite entrance to Soldiers' Home on National Avenue. Electric Cars, National Ave., run to farm every five minutes.

40 OFFICIALLY TESTED COWS AND HEIFERS 40

Among these will be found the great heifer **Duchess Ormsby 2d's Hengerveld DeKol** who holds the **World's Record** for heifer with first calf, having made at age of 2 years, 1 month, 29 days, 19.02 lbs. butter in seven days.

DAME MARJORY DE KOL, a half sister, with record at 2 years, 4 months and 24 days of 16.19 lbs. butter in seven and 65.08 lbs. in thirty days.

LISCOMB AAGGIE 3D at 3 years, 11 months and 26 days with record of 21.58 lbs. in seven and 86.69 lbs. in thirty days.

PIEBE QUEEN 2D'S PRINCESS at 4 years, 9 months, with record of 22.18 lbs. in seven days.

WIT DUCHESS at 5 years, 5 months, 5 days, with record of 24.88 lbs. in seven days.

A FINE LOT OF HEIFERS FROM OFFICIALLY TESTED DAMS. A few richly bred young bulls and the two great service bulls **De Kol 2d's Paul De Kol No. 2** and **Gem Pietertje Hengerveld Paul De Kol** will be included in the sale.

Altogether this is the most desirable lot of Holstein-Friesians, either from the standpoint of the breeder or dairyman, that has ever been offered at public auction. All are cordially invited to be present.

Catalogues ready early in April. Send for one. Address

WOODLAKE HERD.

Advanced registry Holstein-Friesians of leading families at reasonable prices. Small calves of both sexes cheap. JOHN B. IRWIN Station D., R. 1, Minneapolis, Minn.

A Wisconsin Herd Record—Over Three Hundred Pounds of Butter per Cow—Building a Stone Silo.

ED. HOARD'S DAIRYMAN:— I have been very much interested, reading in your paper the reports of the Creamery Patron's Investigation and was surprised to see what a small amount of money the most of them got from a cow in a year.

Now as I have kept a record of my cows, all the time for one year beginning the 25th day of November 1901, and ending the 25th day of November 1902, I will send it to you

No. of cows, 10; lbs. of milk, 70,735; average test, 4%; returns from factory and creamery, $644.56; average lbs. of milk, per cow, 7,073; average amount received, per cow, $64.45; average price, per hundred lbs. of milk, 91c. Two of these cows were two-year-old heifers.

I have chosen these dates because in the summer I took my milk to a cheese factory and that was the date they closed and in the winter I sold my cream to the creamery.

As I have only been keeping cows 2½ years and had bought all the cows except the two heifers, so they are a mixed lot, I thought I had done fairly well. I have not counted the skim milk anything.

Now I intend to build a stone silo this summer and would like to ask you a few questions.

I have a barn built on the side hill with an 8 ft. stone wall under it.

I intend to make my silo on the up hill end of this barn digging down 6 ft. below stable floor making 14 ft. in the ground. How is that for depth in the ground? I intend to make it 16 ft. inside diameter and 30 ft. high.

Can I leave a space for the door 8 ft. from the bottom of the stable door to the top of the ground without weakening the building, to hurt any, as it would be easier getting it out.

I have good quarry rock and intend to build the wall 18 in. thick above ground. Will it be necessary to put a wooden jacket around this to keep if from freezing, if so how would you put it on?

How much will the ensilage settle and in a silo of that depth how close to the top will I need the upper door? Will it be necessary to bed iron rods in this wall to keep from spreading as I have nice flat rocks to make it out of? If so, how often will I put them in?

How do they keep them perfectly round when they are making them, what do they use seeing they can not use a line?

I have never seen a silo so all I know about them I have read and these questions I have not seen. W. H. G.

River Falls, Wis.

Evidently the "man behind these cows" was a dairyman in fact as well as in name. The trouble with too many cow keepers is that they are only nominal dairymen, do not make a study of their business, keep no records, are not sufficiently interested to read dairy literature and have no pride in the work. If W. H. G. can have cows that yield 7073 lbs. of milk in twelve months, containing fat enough to make 330 lbs. of standard commercial butter, why should not others do approximatly as well? Putting a very low estimate upon the value of the skim milk and whey, these cows earned their owner $75 each. Deducting the value of the feed eaten and the labor required to care for them the net income from each cow was not less than $25. Besides, they furnished a home market for hay and other coarse fodder and some grain and returned a lot of fertility to the land. Verily, *dairying* does pay.

As to that stone silo, we may say that more and more progressive farmers are coming to believe that the time has come when silos should be built for the future as well as for the present, and are constructing them of stone, or brick or concrete. The more or less freezing of the silage next to the wall is not found to be particularly objectionable in practice, provided the silage is not fed to the cows when frozen, but when fallen or broken off is allowed to lie on the surface of the warm silage near the center and thaw out.

We should prefer to have the bottom of the silo not more than four feet below the level of the feeding floor of the stable, as then one can walk up an inclined plank and carry a basket of silage. Two feet more depth would make this a good deal more difficult and in our judgment outweigh advantages. There is no trouble in having a continuous doorway from the top of the wall down to the level of the feeding floor, as we have demonstrated in our personal experience, but we would not have this opening more than three feet wide. You may set a 4×4 in the wall on either side of this opening, four inches back from the inner face of the wall, and spike a 2×4 ft. to these to serve as a jamb to hold plank for closing the opening as the filling progresses. Use clay at the ends of these planks and edges to seal them so as to exclude the air.

It is not possible to say how much the silage will settle, but an opening four feet from the top will be convenient enough. Probably the silage will not settle that much, but one can dig down to it. At the present time, however, silos with a continuous opening, as shown on page 174, appear to be preferred. We think a wall built as described will be sufficiently strong without bedding in rods or wire, but as it is a simple and inexpensive thing to do, one might put occasional strands of common barbed fence wire. To insure a perfect circle, set a small post or rod in the center, and measure from it with a pole of proper length; or, after the first course is laid, let the mason use a plumb.

Warming and Ventilating a Barn.

ED. HOARD'S DAIRYMAN:—Having been requested to explain my system of warming and ventilating barn and warming the water, I will give an outline of it, and should any one wish for more particulars with regard to it will be pleased to do so at any time. The stable is a stone basement, after plastering it on the inside to keep out the air, and putting in double doors to keep out the cold. Back from the barn a few feet dug a cellar (this could be under the barn as well) some 8 feet deep and stoned it up some 12 feet square, put a roof over it to keep it from the storms. In this put a small size hot air furnace, the same as used to warm a church or house; run up the side of the barn a smoke stack.

From the top of the furnace a 15-inch pipe runs slanting up in the barn, and comes in under the floor. Now the furnace is fed with the air from the outside, and as it is warmer it passes up in the barn; this brings new air in the stable, all the time. This warms the barn, and as you will see ventilates it as the pipe brings in pure air as fast as the cows consume it, and the foul air is carried off at the top by ventilators. This will keep the air pure. Should it be so warm that you need no fire, open the inside doors or let in air some other way. It does not require a hot fire, but enough to keep the air pure, and at a heat of about 70.

This will require about 3 tons of coal, that will cost about $15 here. The water is pumped with a wind mill up in a cistern a little above the barn, built of stone and cement under ground to keep it from the frost. From the bottom of this cistern is an iron pipe that carries the water down in the stable, across the stable, under the floor and down in the cellar in the furnace, and passes around in the furnace in a coil of pipe 3 or 4 times and then comes up in the stable and runs in an iron tank placed over where the hot air comes in the stable, some 6 inches above the floor.

The hot air strikes against the tank, then passes off into the barn. This keeps the water warm, and by putting a faucet on the end of the pipe in the stable, and letting a small stream run, you can keep the pipe full in the furnace until you raise it to any heat required. Some will say it costs too much.

The furnace, all put in, costs about $60, and the water is no more than every farmer should have, and any farmer knows 30 cows kept as I have described, will give nearly $60 more milk every month, with milk at nearly $2 per hundred as here.

The cows are let loose, 3 or 4 at a time, morning and night and go to this tank to drink. They should be watered at night, after they have eaten their dry hay, if you want a flow of milk.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

Is it Safe to Make Cows Go Dry?

ED. HOARD'S DAIRYMAN:—I have received a letter from one of your subscribers in Bucks county, Pennyslvania, who, referring to my herd record published in the DAIRYMAN of March 13th, says: "Is it safe to make cows go dry? I tried to force one of them to go dry and had a lot of trouble with her udder, I had not the courage for another start in that direction, but if I milk the cows up to calving, they don't give much more after than they did before. Will you tell me how you force your cows to go dry?"

As this is a subject of much importance and I was in the same situation a few years ago, I thought probably my experience might be beneficial to all the readers of your paper.

Seventy days before calving I cut off all grain from the cow and if in the winter, also the silage; after a week of this treatment I milk the cow once a day and another week I milk every other day, then stop short; you must stop some time for if you continue to milk, the cow is bound to respond. Sometimes, two or three days after I have stopped, if I find the udder caking, I milk out a little to ease it up, but in most cases this does not happen.

The cow should be thoroughly dry at least six weeks before calving. The trouble with most people is, that they continue to milk the cow irregularly up to within four weeks of calving; at that time the cow has begun to freshen, and if they stop then, trouble ensues from the new milk forming, and the udder is likely to be spoiled. If the cow is not dry four weeks before calving, better keep on milking the rest of the period. My experience in milking up to calving is the same as your subscriber's. I get no appreciable iucrease of milk.

Many people tell me that they do, but every time I have tried it I have regretted it. I am satisfied that I can get more pounds of milk from a cow by milking her ten months in a year than by milking her twelve. The great trouble with most people in drying up cows is that they are afraid to stop milking, but stop you must if you force them dry, and in 99 cases out of 100, nature will take care of the surplus milk, but avoid giving any food during the drying up process that will stimulate milk production. J. W. HELME.

Adrian, April 4.

The Value of Alfalfa In Hog Feeding.

An interesting experimeut in feeding pigs was recently carried out by the Nebraska Experiment Station. Twenty hogs, uniform in size, were divided into four lots of five each. One lot was fed exclusively on cornmeal, a second on corn meal with milk, a third on corn meal and shorts (80 per cent of the corn meal and 20 per cent of the shorts), and the fourth on cornmeal and alfalfa—80 per cent of the meal and 20 per cent of the alfalfa. The alfalfa was in the nature of chaff, and mostly leaves, consequently richer than the whole hay would have been, being valued at one-third more per ton than whole hay would be.

It was found that the hogs fed on corn alone ate nearly 7½ lbs. of feed to one pound of gain; those fed on corn and shorts required 5.8 lbs. of feed to one pound of gain, and those fed on corn and alfalfa gave the same result. The hogs fed on meal and milk made one pound of gain for 5.2 lbs. of feed. Corn and alfalfa gave as good results as the corn and shorts, and almost equaled corn and meal even in the amount of feed used. In point of economy of gain the corn-alfalfa ration came out ahead, as it was estimated that the hogs fed corn alone cost $4.48 for each 100 lbs. of gain, while the corn and alfalfa hogs made 100 lbs. for $3.40, corn and skim milk at $3.97, and corn and shorts at $3.53

It is not only in the economy of production that the alfalfa comes in. Hogs fed on this showed a greater development of internal organs and more health and vigor than those fed corn alone. A bone from one of the corn-alfalfa fed hogs required 520 lbs. pressure to break it, while a bone of a corn fed hog smashed at 330 lbs. pressure.

Alfalfa thus comes ahead of milk as an economical food, and equals it as one conducive to health and vigor to the stock to which it is fed. It is estimated by the station that $1,000,000 would be added to the annual output of the farms of Nebraska, if alfalfa was substituted for one-fifth of the corn fed to the hogs which are annually produced by the state.

Alfalfa Silage.

A bulletin of the Colorado Station thus summarizes the results of tests of alfalfa as a silage crop:

Some tests were carefully made on a small scale to see what losses might be expected in making silage of alfalfa. One test was made with the alfalfa put in whole as cut in the field, the other with the alfalfa cut the quarter-inch pieces as we cut our corn for silage. The whole alfalfa showed a spoiled layer 3 inches thick on the top and an inch layer around the side nearly all the way down. The silage of the bottom and middle was excellent and was greedily eaten by the cows and calves. Its loss in the total weight was 10.7 per cent, but its loss in feeding value was probably a little larger.

The other silo was filled with cut alfalfa. The next day the silo was covered with two thicknesses of building paper and one of boards and weighted with stone to about 55 pounds per square foot. When covered, the silage was hotter than the hand could bear. Two days later the temperature had fallen to 83°F. and in two days more it had fallen to that of the air. The silage shrank and settled a good deal. When put in it contained 33 per cent of dry matter. On opening, the silo showed 2 inches of spoiled silage on top and half an inch on the sides. The spoiled silage was 7.3 per cent of the total weight. The loss in dry matter was approximately 10 per cent.

It is fair to presume that with a good tight silo, well made silage from cut alfalfa should not make a larger loss than was here given in our small experimental silo, or about 10 per cent of its feeding value. To make good silage from whole alfalfa is a much harder proposition. It requires that the alfalfa be quite green; that the silo be both tight and deep; that the alfalfa be thrown into the silo in small forkfuls and carefully tramped, and that it be weighted by 4 to 6 feet of some heavy, tight packing material like cut-corn fodder. If the alfalfa is put up in the middle of summer, in clear, bright weather, it must be raked and loaded as fast as cut. One lot we tried was too dry for silage two hours after it was cut.

Moldy Silage—Planting Sunflowers.

ED. HOARD'S DAIRYMAN:—I thought I would help J. M. M. & S. out in regard to their moldy silage. We had the same trouble for two years, when we found we were treading it too hard, so hard that it did not heat up to the desired temperature.

We had three men in a silo 13×15×27. For the last two seasons we just had one man in silo, and the result was perfect ensilage. N. P., Springfield, Vt., says either he don't feed it out fast enough, or he put it in too ripe. Neither would cause green mold, certainly not the former, for it is all through from top to bottom.

Then again it makes no difference when you open a silo. It can be as well opened as soon as filled as in winter.

It is not necessary to put anything over it, or weight it down, as N. P. suggests. The corn is about as inexpensive a covering as we can get, and it will not spoil more than six inches from surface. After it has decayed about so far down it becomes hermetically sealed by a white mold and will remain perfect under it for years.

Can any one tell me how much sunflower seed one should use per acre mixed with corn for putting in silo? Also what is a good variety, and how much does it cost a pound? J. H. J.

Morristown, N. Y.

See answer to G. H. W. on page 199.

Returning Pedigree Charts.

ED. HOARD'S DAIRYMAN:—I wish you would write an article calling attention to the fact that pedigree charts should be promptly returned. Many of your subscribers complain of this, and I have out several now that I can't hear from.

Moberly, Mo. C. R.

It would seem that a simple request to return chart after insepection would secure prompt compliance. It is quite a job to make out these charts, and unless sales are made, it would be no more than common courtesy to oblige the owner by returning them.

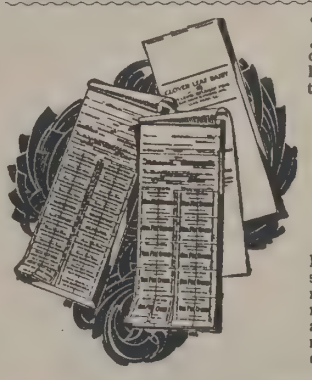
THE MILK CANS TO BUY.

You do not need to be told that there is a vast difference in milk cans. You can make no possible mistake if you select any one of our universally approved **Iowa, Elgin, Chicago, Burn, Omaha** or **Wisconsin** patterns. Made of steel with strong protecting bands, they are the best guarded against denting, and their loaded or soldered inside seams, with heavy tinning and retinning, make them easy to clean and leave no chance for rust to start. In the superior shapes of their non-pull-off handles, they are not approached by any other make. Ours is

A CREAMERY SUPPLY HOUSE

not connected with any trust. In addition to a general line of creamery machinery and milk dealer's supplies, we manufacture such specialties as the **Dairy Queen Churn, Boyd Cream Ripener, Cream and Milk Vats, etc.** If you wish to build a combined butter factory on the co-operative and separator system, write us, and we will send a competent man to organize the company for you. We equip them on strictly sanitary lines, for which our improved appliances are noted. We publish a special appropriate catalog for every specialty and for every branch of our business. Write us for anything in the creamery supply line and we will mail free the proper catalogue.

STURGES & BURN MFG. COMPANY,
Kansas City, Mo. Chicago, Ill. St. Paul, Minn.



Buhl Factory Cans

represent the same maximum of superiority found in all cans bearing our famous Milk Can Trade Mark. They are made to be the **neatest, cleanest, strongest** and **most wear resisting** cans upon the market. It will pay you to know more about **Buhl Cans. Remember** the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round** handle that cannot cut the hands. We shall be pleased to mail you special circulars and other matter, which contain the helpful, money saving information you should have. When you read this you will know why there are more **Buhl Factory Cans** in use than of all other makes combined. Write us direct about cans and we will tell you where you can get them.

BUHL STAMPING CO.,

CONCERNING OUR ADVERTISERS.

Seed Corn is advertised by E. A. Clendenin & Bro., Colora, Maryland.

Do not buy a fence that may injure cattle, sheep, or hogs. There are such fences on the market. The Griswold Field Fence as a horse, cattle or hog fence is unequalled. It is also strong, durable and ornamental. The main features of a good fence lies in its construction and in this regard the Griswold Field Fence is scientifically correct. Its construction is such that it adapts itself to all inequality of the ground. Send for catalogue. The Dillon-Griswold Wire Co., Sterling, Illinois.

We wish to call the attention of our readers to the coming sale of Jersey Island stock to be held at Rushville, Ind., by Case & Walker, April 28th. Write for particulars of the stock offered as directed in the advertisement this issue. It's a grand offering and should be attended by many readers of HOARD'S DAIRYMAN

The following notice from Horace L. Bronson, Cortland, N. Y., regarding his recent purchase for the Star Farm Herd: "One of the important transfers of Holstein-Friesian cattle was made on Tuesday, April 7, 1903, when I purchased for Star Farm, of West Brothers, Syracuse, N. Y., their entire herd of 53 registered Holstein-Friesian cattle. Messrs. West Brothers purchased their foundation stock of these great breeders and importers, Dutcher & Son, of Pawling, N. Y., and other noted breeders. They obtained at the outset the very highest strains of blood possible for their foundation stock. They bought the best without reference to expense. They have used some of the best sires obtainable. There will be found in this herd sons and daughters of DeKol 2d's Alban, direct descendants of DeKol 2d, Pietertje 2d, Grace Posch's DeKol, Maple Kroft De Kol Posch, Daisy DeKol, Netherland Alban, Netherland Prince, Pietertje 2d, Koningen, Keyes Six, Clothilde 4th Imperial, Shadeland Consul, Neeta Paul's Son, Neeta Paul, (the sister of Pauline Paul) and other great cows and bulls of the breed. As a lot this herd is exceedingly handsome, large, beautifully marked and present a very pleasing appearance. There is combined in the herd, not only richness of breeding, but the highest individual excellence. My sales from Star Farm have been so heavy during the past six months that I found it necessary to replenish the stock. Not willing to accept anything but the best, I determined upon the purchase of the entire herd of West Brothers. I shall now be able to nick the blood of Pietertje 2d and 3d, DeKol 2d, Imported Shadeland Duke and Jessie, Grace Posch, Daisy DeKol and Clothilde 4th, with the blood of Johanna Rue 2d, Paul DeKol and Mercedes Julip's Pietertje. Am sparing neither trouble nor expense in improving Star Farm Herd, and cordially invite all interested in this breed of cattle, whether purchasers or not, to personally inspect the herd. Visitors are always welcome."

"We have used Zenoleum for a number of years with great satisfaction, and are still using it in large quantities. We consider it one of the very best disinfectants we have ever used, and in our judgment, it will do all that you claim for it." DUNHAM, FLETCHER & COLEMAN, Wayne, Ill.

In this day of labor saving machinery some sort of power has come to be well nigh indispensable on the farm. It is put to scores of profitable uses, such as pumping, sawing, grinding, churning, separating cream, etc. The varied line of engines running from 2½ up to 300 horse power, manufactured by the Weber Gas and Gasoline Engine Co., of Kansas City, Mo., and advertised in our columns, supplies what is admirably adapted to every possible need. These Gas and Gasoline engines are simple and perfectly safe, are most economical in the use of fuel for the power they furnish, and no experience or training is necessary to operate them successfully. Consult the advertisement and write the Weber Company for their free catalogue if you need anything in the power line.

The American Shorthorn Breeders' Association will Move Headquarters.

The business office of the American Shorthorn Breeders' Association will soon be removed from Springfield, Ill., where it has been located since January, 1894, to the new Live Stock Record Building, Union Stock Yards, Chicago, Illinois.

This move will be made as soon after May 1st as it is possible to pack and ship our effects, and we expect to be in our new quarters by Monday, May 11th, prepared to do business.

After May 5th patrons of the office will please send all communications to our new address as given above.

JOHN W. GROVES, Sec'y.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Heart Trouble.

I have a cow taken sick two months ago with a terrible grunting, and appeared short of breath, and in a few days she ceased making the grunting noise but refused to eat for a time. Then she began to eat good food such as middlings and corn meal with clover. In a week or two she began to eat less and now will eat scarce anything. She is now swollen very much from the under jaw, legs and brisket, and all she eats is a little skim milk and a bit of clover. G. A. D.
St. Paul, Minn.

ANSWER.

The cow has heart trouble for which the causes are very numerous. She will not recover, no matter what you may do for her but may live for several months; the time will depend upon her general strength and vitality.

Failure to Breed.

I have a registered Jersey heifer one year old that has come in heat and has been bred four times, coming in heat every 21 days. Is there any thing I can do to get her with calf? She is in good flesh. H. S. M.
Morrisville, Vt,

ANSWER.

If the heifer is in high flesh, this may be the cause. Reduce the flesh and change bulls.

Warbles.

Can you tell me of any remedy, or rather prevention, for gad fly grubs in the cows' back?
Heronsmere, B. C. O. A.

ANSWER.

See Warbles, page 134.

Warts.

Three cows have a small hard bunch under the skin about as large as a pea, on the lower part of teat. They show it causes pain when milking. It does not seem like a wart, but looks white.
Waterviet, Mich. E. A. S.

ANSWER.

The knife is the safest remedy, when she is dry.

Abortion.

Refer me to a copy of HOARD'S DAIRYMAN containing a description of treatment for abortion.
Cleveland, Ohio. C. T. B.

ANSWER.

See page 66 and 67 of the DAIRYMAN.

Milk Fever.

I notice you advise Schmidt treatment for milk fever in your issue March 6th. I am a new subscriber. Will you kindly advise me what this is?
Norwalk, Conn. M. O. C.

I have trouble with milk fever. Will you please give me the Schmidt treatment? J. S. W.
Clearfield Pa.

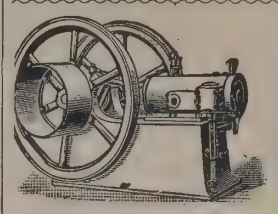
I see in your paper that you recommend Dr. Schmidts cure for milk fever and I see in January 2, page 978, column 4, that it is sterilized water or sterilized air. I wish you would explain what that treatment is and where I can obtain it.
California. D. W. G.

I am a new subscriber to the DAIRYMAN. Will you kindly print Schmidt treatment for milk fever in the paper? I have a cow that is dry and she has cut the end of one of her teats off, a piece about one-half inch long. She will be fresh in about two weeks. What treatment will she need? Please answer both questions in HOARD'S DAIRYMAN. A. F. STRONG.
Galena, O.

ANSWER

The Schmidt Treatment for milk fever as given by the DAIRYMAN'S Veterinarian is as follows:—

Dissolve 2½ drams of potassium iodide in a quart of water which has been previously boiled, and keep the solution as nearly as you can at the temperature of body blood. Then milk every drop of milk from the cow's udder, and clean with soap and water; when dry disinfect the udder and teats with a solution of Zenoleum or Chloro-Naptholeum (1 teaspoonful to a pint of water.)



Then take a small glass funnel and attach to same a rubber hose about 4 or 5 feet long, affix to the end of this hose an ordinary milking tube, insert the milk ing tube into the teat and slowly pour in your solution, dividing it equally between the four teats; when this is done apply massage to the entire udder for 5 or 10 minutes every hour, until the cow comes to her feet. Do not allow the calf to suck while the cow is being treated. If the cow is costive, remove the contents of the rectum by hand. In case of a weak heart, small doses of aromatic spirits of ammonia may be given with water every hour; avoid large and bulky doses, or your patient may suffocate from same. If your patient is not on her feet in 8 or 10 hours, the above dose may be repeated, but it is rarely necessary. This is practi-

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

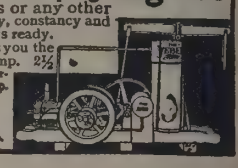
THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our Volume Governor gives uniform speed. Our Acme Mixer is the most positive and economical on the market. Our Hand Starting Lever starts engine with least effort. All bearings of Phosphor Bronze. Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

J. THOMPSON & SONS MFG. CO., 113 BRIDGE ST., BELOIT, WIS.

Cherry's Perfected Barn Equipments.

Operates on Curves and Switches. Manure Carrier, Feed Carrier, Grain Elevator and Track. Barn Door Fixtures and Track. Hay Tools.

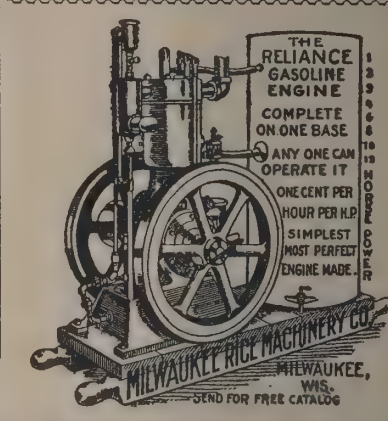


Send for Illustrated Catalogue and Price List to D. B. CHERRY & CO., Knoxville, Iowa.

WEBER Jr. Gasoline Pumping Engines

excel windmills or any other power in amount of duty, constancy and cost of running. Always ready. A trifle for gasoline gives you the water 30 men could pump. 2½ full horse power for any purpose. All sizes up to 300 h. p. Write for free catalogue.

Weber Gas and Gasoline Engine Co., Box 176 Kansas City, Mo.



THE DREW ELEVATED CARRIER

is the cheapest and most practical device for taking away manure from stables, carrying ensilage, feed, grain, etc., etc. No trouble to put them up; no trick to work them; leaves barn yard free from posts; dump in yard or on wagon; turns curves and switches. An inexpensive money saver. Write for illustrated catalogue and full particulars.

DREW ELEVATED CARRIER COMPANY, WATERLOO, WIS.

If you want a..... Gasoline Engine

that will be always ready to start, safe, reliable convenient, economical and durable, buy a FULLER & JOHNSON Frost Proof. No bother with water nor expense of broken cylinder, no waiting for wind or weather. All sizes, stationary and portable. Send for descriptive catalogue to the manufacturers.

FULLER & JOHNSON MFG. CO., Madison, Wis.

NEW DOORS AT $1.00 EACH

Bought at Sheriff's Sale of Sash and Door Factory. 10,000 NEW DOORS ranging in price from $1.00 up. ALL SIZES. Write for complete list. Our mammoth Catalogue No. 20 on Lumber, Roofing, Pipe, Machinery, etc., from Sheriff's and Receiver's Sales, mailed free of cost.

CHICAGO HOUSE WRECKING CO., WEST 35TH AND IRON STS., CHICAGO.

ILLUSTRATION.

A special train of twenty-two large cars carrying nothing but Hapgood-Hancock Disc Plows left the Hapgood Plow Factory at Alton, Ill., on the Wabash, January 20 last, landing in Kansas City the afternoon of the 21st. This large train was profusely decorated with American flags and large banners proclaiming the contents of the cars, and at the rear of the train was placed a cannon, which boomed out salutes along the route. This is the largest single shipment of disc plows ever made, and shows the popularity of the Hapgood-Hancock line of disc plows among the farmers of the West. The farmers of Kansas will profit directly by this large shipment, as the entire $55,000 worth of plows in this train load are destined to Kansas points for spring demand in that state. The Hapgood Plow Company are exclusive manufacturers of the celebrated Hancock Disc Plow, and guarantee them to be the only absolutely successful disc plow on earth. Circulars and catalogues of this and all other desirable implements for farmers and ranchmen are sent free to our readers on request made direct to the makers.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman,"

a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Pleas mention this paper Send for catalogue. THE TEMPLE PUMP CO., ESTABLISHED 1853. Meagher and 15th St., CHICAGO.

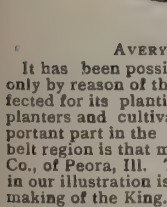
What Prof. Carlyle, University of Wisconsin, Says About Zenoleum Dip:

"It gives me much pleasure to state that we have used Zenoleum as a disinfectant in various ways about our live stock barns and stables, and have found it very satisfactory indeed for this purpose. We have used it as a sheep, cattle and swine dip, and have found it an excellent remedy for parasites of various kinds. I can recommend its use to stockmen generally for the purpose mentioned." PROF. W. L. CARLYLE, Madison, Wis.

Send for copies of "Zenoleum Veterinary Advisor" and "Piggie's Troubles" and see what others say about it. Books mailed free. Sample gallon of Zenoleum $1.50, express prepaid. "The Great Coal Tar Carbolic Dip." ZENNER DISINFECTANT CO., 34 BATES STREET, DETROIT, MICHIGAN. Five gallons $6.25, freight prepaid.

HOOD FARM
Antiseptic
Breeding Powder

Makes Cows Breed After Abortion. Corrects Failure to Come In Season and Failure to Clean.



"I had a heifer that aborted her first calf and she failed to breed again, though three different bulls were tried. I decided to give Hood Farm Antiseptic Breeding Powder a trial. After one month's treatment the heifer was bred successfully and in due time she gave me a fine heifer calf for which I have been offered $25." JOSEPH MASON, Bacon Farm, Newton Highlands, Mass.

Price, $1, sent by mail, $1.15. Size containing four times this quantity, $2.50. Sent prepaid for $2.75. Address

Waukesha Co., Wis, 274 acres. 125 acres under plow; 104 acres oak timber; 40 acres hay land; a good orchard; fine buildings; good soil. A fine dairy farm and summer resort, ½ mile lake frontage. Price and particulars of **Hiles & Myers,** C-100 Matthews Bldg, Milwaukee, Wis.

ILLUSTRATION.

AVERY CORN PLANTERS.

It has been possible for corn to become King only by reason of the machinery that has been perfected for its planting and cultivation. A line of planters and cultivators which has played an important part in the development of the great corn belt region is that manufactured by the Avery Mfg. Co., of Peora, Ill. The Corn Queen Planter shown in our illustration is doing its full part toward the making of the King. It was happily named. It is the embodiment of those queenly qualities in highest form of usefulness which compel recognition and admiration from those who know what well adapted machinery at planting time means. Numerous features have singled it out for preference over other planters, prominent among which is the accurate and dependable drop. And on the matter of the drop depends, after all, the actual worth of the cultivator. The same device is employed both on the Corn King and Queen manufactured by the Avery Company. Drops on other cultivators are frequently changed in the hope of finding something to equal the Avery device which seems to be the type for many others to emulate. The Avery planters not only rest secure in their superior and exclusive droppers, but are highly valued on every point which goes to make the perfect planter. In making a selection of a planter, the Avery's should be among the first considered. No corn grower makes a mistake if he extends his investigations no further.

cally the Schmidt treatment, and is almost a specific.

The injured teat had better be kept clean with Castile soap and warm water daily until the sores are healed up. Make an occassional application of lard to keep the parts soft.

Ticks.

I have a horse which has, I think, wool ticks. They are gray color, small head, numerous legs and about as large as the end of my little finger and flat. They bury in the hair and seem to be filled with blood. What is their nature, and what must I do to get rid of them, and what is the cause, effect on the horse, and what are they called? X. Y. Z.

Fort Atkinson, Wis.

ANSWER.

We cannot tell without a personal examination.

Mud Fever—Stock Food.

What can I do for a horse whose legs below knees and gambrels have lately become somewhat swelled, feverish and tender to the touch, hair seems to loosen up in spots and scabs appear. Horse has been worked for several weeks in very deep mud. People here call it mud fever, but I can't find any such name in any doctor book or in any of the back numbers of the DAIRYMAN,

Will you give formula for a good medicinal stock food such as ——which sells for from 8 to 10 cents per pound, and which we are told and have reason to believe, is composed largely of charcoal, salt and oil meal. W. R. R. C.

Gilbertsville, N. Y.

ANSWER.

1. Mud fever is due to exposure to the mud and allowing the same to dry on the legs, which irritates the skin and causes it to crack and become inflamed. Wash the parts clean with castile soap and rain water twice daily and apply a warm linseed poultice over the sores after each washing for three or four days. After this you may apply an ordinary oxide of zinc salve once daily. Give one to two ounces of sulphate of soda in drinking water once daily.

2. There is no stock food better and healthier for your stock than that which grows on your farm, if it is pure and clean.

It is no more advisable to be constantly administering medicine to stock than it is for man to be doping himself continually. The time to give medicine is when an animal is sick, then you must apply the remedy that is indicated in its particular case in order to derive a benefit. In any other way medicine is of no use whatever, and in some cases harmful.

Is Garget Hereditary?

J. S. Martin, Tillamook, Ore., asks if garget can become a chronic disease, also is it hereditary. He has a cow whose ancestors he has traced back for 4 generations and he finds that this cow as well as her mothers, have been afflicted with it.

ANSWER.

As far as known to the present day, garget in itself is not hereditary, but the weakness and lack of resistance of these parts is very often inherited from the mother.

The Schmidt Treatment for Milk Fever.

The directions for administering the Schmidt treatment say, "let the solution remain in the udder about twenty minutes and milk out." Direction given at another time say nothing on this point. Please tell us through your columns whether the potash solution will do any harm if allowed to remain in the udder several hours.

CLOVERLAND DAIRY FARM.

St. Bernard Parish, La.

ANSWER.

You have never been directed in these columns to milk out the solution of iodide of potash at all. The solution remains in the udder until it is taken up by the circulation, and before it has so been taken up, you will see no results. What would be your object to inject it if you were to milk it out again? You must not forget the manipulation of the udder after the injection.

The Schmidt treatment as given by me will be found in answer to A. F. Strong, Galena, O. I cannot account for any other statements in this paper but my own, which I am ready to back.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe, Speedy, and Positive Cure

The safest, Best BLISTER ever used. Takes the place of all liniaments for mild or severe action. Removes all Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

"SAVE-THE-HORSE" SPAVIN CURE

POSITIVELY AND PERMANENTLY CURES bone and bog spavin, ringbone (except low ringbone), curb, thoroughpin, splint, capped hock, shoe boil, weak and sprained tendons and all lameness.

——FOOL TALK——

About 35 years ago a young mechanic called on old Commodore Vanderbilt, then head of the New York Central Railroad, in an effort to secure a trial on a New York Central train of a new device for stopping trains by compressed air.

"Air!" the Commodore is said to have exclaimed. "Air! Stop a train with air! I've not time to listen to such 'fool talk,' young man," and he didn't. Neither would anyone else for many a long day

George Westinghouse, for he was the man of the "fool talk," believed in himself and the utility of his invention. He kept right on in spite of Commodore Vanderbilt and the others till he forced recognition. Would a man trust himself aboard a passenger train today if he knew that train was not fully equipped with Westinghouse's invention—the air brake? It is said that Vanderbilt's road had some difficulty in getting it when finally it was wanted.

Many a man says "fool talk" when he reads the claims made for "Save-the-Horse" spavin cure, but the dawn of enlightenment is as certain as the rising of the sun, and the man who says "fool-talk" after reading the facts so plain and convincing as given by us, reaffirmed by the letters published in these columns every week, and in our booklet, is repeating Commodore Vanderbilt's mistake. No man need be in doubt as to what "Save-the-Horse" spavin cure can, and cannot, do. If you have a case different from what are described in booklets and advertisements, send us full particulars as to the age, location, cause of the lameness or swelling, the horse's action, previous treatment, and also the veterinarian's diagnosis, if you know he is competent, and we will tell you frankly as to the possibilities of our remedy. Write for booklet and copy of guarantee and any information desired.

Heed this:—

Work horse continuously if desired.

"Save-the-Horse" cures without scar, blemish or loss of hair.

Contains no arsenic, corrosive sublimate or other form of mercury or any ingredient that can injure the horse. $5.00 PER BOTTLE.

Written guarantee with every bottle.

There is no condition or arrangement we can make more binding to protect you than our guarantee.

NEED OF SECOND BOTTLE IS ALMOST IMPROBABLE EXCEPT IN RAREST OF CASES.

$5.00 at all druggists' and dealers', or express prepaid.

TROY CHEMICAL CO., Troy, N. Y., manufacturers.

Also Veterinary Pixine, for grease heel, scratches, speed cracks, cases where ulcerations extend, with transverse cracks which open at every step and often bleed, no matter how complex, aggravated, deep seated or chronic; if treated according to directions, as given on circular with every box, positively cured.

KEEPS HOOFS HEALTHY, SOFT AND IN PERFECT FORM.

Heals collar and saddle galls, hopple chafes, abcessess and all skin diseases.

Two oz., 25c.; 8 oz., 50c.; 5 lb., $4; all druggists and dealers, or sent prepaid.

ABORTION,

Failing to Breed and to bring Cows to Heat. Sure Cure. In use 20 Years.

(Patent Applied For)

Hard Rubber *Safety* **Milk Tubes and Dilating Plugs** to cure hard milkers and a teat **Bistoury.** Send for testimonials.

Dr. WM. HORNE, Janesville, Wis.

BLACKLEGOIDS

BEST PREVENTIVE OF BLACKLEG.

Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each **Blacklegoid** (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. **Blacklegoids** are sold by druggists; *ask for them.*

Our newly printed eight-page folder on the "Cause and Nature of Blackleg" is of interest to stockmen. Write for it; it is free.

BARREN COWS CURED.

Our treatment has been used successfully since 1878 in every state in America, Canada and Great Britian. Write for Pamphlet.

MOORE BROS., Veterinary Surgeons, Albany, N. Y.

CURE "THE" COW

NO CURE, NO PAY

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of the remedy—$2.00 per quart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address

DR. EATON J. CROSS,

152 Congress St., Troy, N. Y.

Clarified Milk.

ED. HOARD'S DAIRYMAN:—In your paper for March 20, page 132, is an article by F. L. Marion, of Mass., with the above headline which I think deserves a reply. Mr. M's. assertion that clarified milk is not milk simply on account of the strong tearing apart force of centrifugal separation and following remixing of the cream and skim milk, is certainly unwarranted, as is also the idea that the small amount of solids removed in the slime, besides impurities, by the centrifugal force should deprive the milk of any particularly sanitary properties.

In a perfectly sweet milk the amount of slime is so small that it could not be of any importance. It is quite natural that Mr. Marion does not favor the idea of clarifying milk, because that very process in connection with pasteurization is making it possible for the City Dairy Co. Limited (as Mr. M. calls it) to successfully compete with those few dairymen, who, like Mr. M., are located near enough to the cities, and possessing modern sanitary facilities.

As I have said before, unfortunately such pure, sanitary raw milk, which can be honestly guaranteed as free from any disease germs or preservatives is so scarce and so expensive, that only very few people can get it or are able and willing to pay the high price. Certified milk, guaranteed by individual producers or by milk commissions certainly cuts no figure whatever in the milk supply of any city, though both health boards and medical societies have strained every effort to push it.

I would like to know what Mr. Gurler of DeKalb, Ill., and other prominent producers of certified milk, who are running all their milk through a separator for cleaning purposes, would answer to Mr. Marion's assertion.

Mr. Marion says, that the clarifying process is of less public benefit than pasteurization, and in this I agree with him. While centrifuging surely removes every particle of impurities which have found access to the milk, still it has been well proven that it has slight effect in removing bacteria, which in fact often are increased instead of lessened, because the milk is held at a favorable temperature for their growth and often exposed to impure air. Thus for city milk supply clarifying alone will rather shorten its keeping quality, if it is not followed by careful pasteurization.

Mr. Marion is perfectly correct when he says, "milk should not need clarifying" (as I sincerely hope his does not) and I have wondered somewhat that even H. B. Gurler clarifies his milk, which comes from a dairy as carefully kept, I am sure, as Mr. Marion's. But as long as millions of young children live in our cities, there is only one practical way to supply them with sanitary milk, and that is by clarifying and proper pasteurization. Mr. M. says: The thing to insist on is sanitary conditions in stables and scientific cleanliness in milking and——Sure! we all agree to that, but what has all that insisting accomplished?

Mr. Marion is entirely right when he suggests that "milk on each route should be milk from the same dairy each delivery," but the suggestion is absolutely impractical for a large business. Purity and uniformity are the two essentials required for an ideal milk supply, and such can only be gained by a thorough mixing of the milk from the various dairies every day, and by then clarifying and pasteurizing it and at once filling it in sterilized bottles for delivery. That this method is successful, as well as practical from a milk dealer's standpoint, also can be seen from the rapidly increasing introduction of pasteurization by one large milk supply firm after another.

A CREAMERY FOR 25 COWS.

On page 132, March 20, is an inquiry and reply under above headline. While otherwise your plan may be all right, I am sorry that you did not consider at all the advisability of pasteurizing in such a well arranged, private creamery. While I do not believe in a great future for private dairy creameries, still when shipping of the milk to creameries is impracticable, I believe that such small private buttermaking dairies should be arranged up-to-date.

If cold water can be had in any abundance, it certainly will pay well to adopt pasteurization of all cream for buttermaking. It will mean a great convenience and saving of time, because if the fresh cream from the separator is pasteurized at once and cooled to 55° or lower, it may be held in absolutely perfect condition for 3 or 4 days, then ripened and churned twice a week, and make the finest article of butter of the greatest keeping quality. I have tried it and know and advise your inquirer to think it over.

Canton, O. J. MOLDENHAWER.

Time for Dehorning.—Destroying White Clover in Alfalfa.

ED. HOARD'S DAIRYMAN:—Having read in a recent issue the inquiry of one J. H. W., Casky, Ky. "When to dehorn," it is getting rather late to dehorn this spring, but if his cattle are only 12 or 18 months old, there is time yet. If he is afraid of flies he can put on a little pine tar. Dehorn with a saw. Cut so there will be a fringe of hair all around the horn after it is off. It will heal quicker and there will be no stubs or scars. After a calf is 4 months old the horns are big enough to cut off, but be sure and cut close and there will be no stubs.

Mr. N. B., Faribault, Minnesota, wishes to know if alfalfa can be threshed with a common thresher. It can. Also what is an average crop? I don't think there is such a thing as an average crop. Here in Kansas, it runs all the way from 1½ to 10 bushels. If the weather is hot and dry, when the alfalfa is blooming the yield will be good. On the other hand, if it is wet and cloudy it will be a failure. He can harrow his alfalfa, it will do it good, but I don't think it will kill out the white clover. If the alfalfa is old enough I think he can disc the clover out by going over the ground both ways. I have some alfalfa that was sowed 3 years ago and also some that was sowed September 1901. I have disced all of it and am disking the old stand the second time. M. H.

1/2 At One Half the Cost

Lion Coffee

has better strength and flavor than many so-called "fancy" brands.

Bulk coffee at the same price is not to be compared with Lion in quality.

In 1 lb. air tight, sealed packages.

$28 FREE

FOR A TESTIMONIAL

You can have ripe tomatoes June 15th, ripe melons July 1st, new potatoes and cucumbers May 15th. All other vegetables or flowers as early by using Gold Mine Hot bed. It protects all kinds of plants from frost, cold raw winds and storms. Keeps off the bugs, insects, cutworms. Stimulates plant life in such a manner as to make them grow three times as fast. Indorsed and recommended by every agricultural paper in the United States, and by every farmer that has used them. There is not a Tool or implement that the farmer buys that will bring htm in as large returns each year as this. It will pay for itself forty times a year, with proper usage.

We have reduced the price from $1.50 per dozen to 85 cents, for immediate acceptance. Sold on the same guarantee to give satisfaction as plows, binders, and mowers are sold, or money refunded. When you find they are better than you expected them kindly send us a testimonial. Next year you will want more of them; we will reciprocate your kindness with a present.

We will give 200 Gold Mine Hot Beds to the person sending in the best report; 100 for second best; 50 for third; value $28, and pay all charges to destination. Premiums paid in November. Points considered—Earliness yield, amount of money made, with one dozen. Please do not delay your orders.

404 GREAT NORTHERN BUILDING.....CHICAGO.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x14. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

Fine Dairy Farm for Sale.

Near St. Paul, Minn. 210 acres good land with ample buildings of all kinds. Page fence, cedar posts. Pure bred Holstein cattle and Yorkshire swine sell readily at good prices. Good markets for all dairy products. Will sell with or without stock and other personal property. Easy terms. Enforced removal to California only reason for selling. **T. S. TOMPKINS, Pasadena, Cal.**

Wanted Farms, Ranches, Timber Land, Town and City Property, Mills, Dry Goods, Grocery, Boot and Shoe, Hardware, and other stores for Cash Customers. Note and Comment.

Eastern and Western Dairymen.—Beef vs. Dairying.—Rations and Standards.

ED. HOARD'S DAIRYMAN:—The winter's campaign of institutes is over and the "invaders, (horse, foot and dragoons)," have returned to their homes, and I suppose ready "to shoulder their crutches and tell how fields were won." For "yours truly," whose circuit reached from Albany, N. Y., east, to Fargo, west, he has only pleasant things to remember, indulgent crowds, friendly listeners who let him down easy, and at one institute even went so far as to invite him to come again.

There is a wide distinction between the eastern institute and the one in far west, though this last is a hard place now to exactly locate. The eastern dairyman is more "sot" in his ways, but fast coming to see that something has soon to be done to adjust himself to the rapidly changing economics of the farm industries. The western fellow is already in the stage of adjustment, and is rapidly changing to a diversified system of farming from the all wheat.

The eastern man is concentrating more and more about the cow as his best industry. The western fellow has so much land, waste feed and fresh air, that he is trying to make of himself a dairyman, beef maker, hog keeper, horse raiser, and wonders why he cannot keep sheep, have a poultry yard and ride in an auto. At the institutes he wants to hear about all of these things. To do so, they turn out by the 500 at an institute—sometimes a thousand—and listen with evident approval to whatever comes.

In Minnesota the dairy talks were always well received. The thought is that a dairy cow can be good in many ways. A dual-purpose cow is not quite enough. She in addition must be a rustler and go with the steers, and grub the stalk lots in all weathers, and still be a dairy cow. Of course, it is the pioneer dairyman out on the border who believes this, and others who imagine that any cow is as good as another if fed as much corn meal.

In the dairy counties are hundreds of the best of dairymen, and as far advanced as any in methods. One can tell the dairy counties at a glance, better buildings, finer barns, and a thrifty look about the farms that tell of fertility, rotation of crops, and progress. Still I want to commend some of the fellows out on the border for pushing on the dairy column. Many a creameryman out there is hanging on by his eye winkers, doing every way to promote the business and get farmers interested in dairying. I recall one man, a Mr. Shay—I think at Slayton—holding on through all discouragements, but stays and actually making 300 lbs. of butter a day this winter from the milk picked up on that wind-swept prairie, and the farmers now see that this means an income; and the dairy, care of cows, stables and the like, were the features of that institute.

There is a spirit rife on the border that beef should be the one, and one alone, great object sought, and any mention of a cow that is less than three feet wide on the back and weighing less than 1,600 pounds invokes a protest. Beef is a great commodity and good prices for it stimulate the thought that it is better to have a cow that gives some milk and makes lots of beef, than a dairy type that gives lots of milk and less beef. But the other half of the story is, that it is supposed to be less work to raise a steer than to milk a cow, and by the looks of thousands of steers I saw roaming the cold, wind-swept stalk fields without any seeming care, or hugging straw stacks, it looked as if the steer was neglected quite as much as his sister. The great lesson to be learned on the border is, it takes special cattle to secure special profits. It needs winter care of stock that makes their living something different from a feast and famine, a saving of fertility, and all of it a thing hardly known, and if known, not visibly practiced much, and as a dairyman, making a distinction between steers and cows as to care, feeding and environment. Along this line the institutes are doing a great work, and I look to see the creameries and the dairies doubled in the next ten years. It pleased me to see the strides already made, for there is a great future before the dairymen of Minnesota, and the quicker they separate the combined milk and beef idea, the sooner will both realize their cherished dream of best results.

My good critic of Ellicottville, N. Y., fails in his understanding of the case of feeding for profit. A balanced ration may cost so much that its profitable feeding is out of the question, and the margin can only be secured by feeding a home-grown or purchased wide open one, until prices again adjust themselves. It is not true that a balanced ration is always a profitable one. It is in adjusting one's self to conditions, and be as ready to re-adjust, that makes profits nowadays.

It is only three years ago that the experiments were inaugurated as to what use cows made of certain elements of their food, and what would result if certain elements were entirely removed. It was found that nature in some way made substitutions, and in others there was no answer as to where some portion of the elements went, in fact, was unaccounted for. Cows for long times performed exceedingly well on a one-sided ration, and in others it would seem that the succulent starches would for a while partially take the place of much protein. The idea at the great meetings I have attended this past winter has been that with the feed largely succulence, like silage, a much wider ration can be fed than could be with the same feeds fed in a dry state. The concensus, though possibly not expressed in Roosevelt's best United States, was that less protein could be fed milch cows and get good returns, and I may have hinted that the old German standard might have been a little strenuous. It was based on what might be called physiological reasonings, that certain elements of food went to support certain bodily functions, that fat in milk could not be made from the starches. Now Prof. Jordan says that fats in the tissues of the body and in the milk glands can be sustained by the carbon part of the ration. I hold that the young, growing animals must have protein to the full amount, but the mature animal may, under certain conditions and circumstances, give us good results on a more wide open ration, and the feeding of the past two years, the time of extreme prices for protein, has shown that the home grown ration may be profitably used to boycot the the commercial price of proteins.

One of the pleasant things I note in my travels is the inquiry made about the summer silo as a method of summer soiling in place of reliance on catch crops. The testimony in every case was most favorable and satisfactory. We have always found that summer silage took the place of grain, if not balanced, and the shrinkage of milk was very small, showing that it is not the season, but the ripening and drying of the pasture grasses that caused the shrinkage. This the silage prevented when fed in amounts of 30 to 35 pounds a day. I see in friend Baker's experience (page 106), a suggestion about clover silage that may be a great aid in the matter. When in the Puget Sound dairy section, I found the dairymen siloing their clover and the report was that the wetter it went into the silo the better it came out, and from my knowl-

MR. MILKMAN My Can Refrigerators take up no extra room in wagon and will prevent milk churning and souring. Booklet free.

S. C. SULLIVAN, 425 W. 4th., Erie, Pa

edge clover should not be wilted, but go onto the wagons right from the cutter-bar, and a few gallons of water to each load would still prove a good preservative. I well remember Bushrod Conant selecting rainy days to fill his clover silo, and while some, like Baker's, spoiled, the greater part came out fine and was eaten with great relish by the cows. I am sure we are on the eve (?) of a great advance in summer silage and may Hoard's be the advance courier to proclaim its success. JOHN GOULD.

Ohio.

Expert Grass Management.

Four tons of hay per acre is the achievement of George D. Leavens of Grafton, Mass. Unlike the friends of the Clark system, Mr. Leavens lays even more stress upon top-dressing than upon cultivation. The trouble is, he says, that most farmers expect a single dressing to last four or five years. His methods, however, somewhat resemble those of Clark. The following extract from his paper read at Worcester, Feb. 28, gives an idea of the system followed:

In preparation of the soil the furrow should be deep. The turning over by the furrow-slice does not give as good results as to leave the furrow-slice standing erect where it can crumble away. The object of plowing is to pulverize, aerate and warm the land. A heavy, cutaway, wheel harrow is the best to use, and it should be kept going fifteen or eighteen times. Riding a harrow is as good for one as an ocean voyage and has about the same rolling effect. This harrowing puts the weeds where the sun will reach and kill them.

Persistent harrowing is necessary to produce a perfect seed bed, warm and mellow. I don't believe we can make the preparation of too much importance. If lime is used, it should be mixed in thoroughly with the harrow. All stones and litter should have been removed. After harrowing with the cutaway harrow is the best time to apply chemical fertilizers. Then a spike harrow should be used to level the ridges, make the soil even and mix in the fertilizer. Then comes the brush harrow or the weeder—I always use the latter.

Before undertaking the sowing of the seed it is well to calculate the size of the field. A field should always be cross-seeded. Care should be taken to sow the whole field or the bare spots will amount to considerable percentage. After another going over with a brush harrow or weeder, the roller presses the seeds down and starts the capillary action which puts the seeds in growth.

I prefer the last of August or the first of September as the time to sow. I wish to speak emphatically against the practice of sowing grass seed in standing corn or grain crops. The ground cannot serve two masters, no more than a man can. The best thing to sow with grass is plenty of grass. The next spring the crop should have a top-dressing of chemicals. A field treated in this way will be fresh and green when others are dry and frozen. Three formulas of fertilizers were given with their component parts and the results. The first was as follows:

Clark's formula per acre; Nitrate of soda, 160 pounds; muriate of potash, 160 pounds; fine ground bone, 480 pounds; total eight hundred pounds. Furnishing organic nitrogen, 14.4 pounds; nitrogen as nitrate, 25.6 pounds; total nitrogen, forty pounds; actual potash, eighty lbs.; available phosphoric acid, 28.8 pounds; free lime, none. Cost for nitrate of soda, $3.36; muriate of potash, $3.20; ground bone, $7.20; total, $13.76. Tons of hay per acre, five; cost of fertilizing per ton of hay, $2.75; selling price of hay per ton, $15 to $18; value of hay per ton over cost of fertilizer to produce it, $12.25 to $15.25

The second formula was that used by Dr. Wheeler of the Rhode Island Agricultural Station. Dr. Wheeler had had some very wonderful results in raising grass on land that was hardly able to raise anything before he fertilized it. His formula is as follows:

Nitrate of soda, 350 pounds, muriate of potash, three hundred pounds; acid phosphate, five hundred pounds; total, 1,150 pounds. Furnishing, nitrogen (all nitrates) fifty-six pounds; actual potash, 150 pounds; available phosphoric acid, sixty-five pounds; free lime, none. Cost, nitrate of soda, $7.35; muriate of potash, $6; acid phosphate, $3.50; total cost, $16.85. Tons of hay per acre, 4.5; selling price of hay per ton, $15 to $18; value of hay per ton over cost of fertilizer to produce it, $11.26 to $14.26.

The formula used by Mr. Leavens himself he called the Grafton formula. He called attention to his use of basic slag and to the large amount of free lime produced. The use of this mixture, he said, gave better results on his soil than either of the other formulas. He attributed it largely to the lime which was valuable in his heavy and damp soil. The formula he used in 1902 was Grafton formula, 1902, per acre: Nitrate of soda, 200 pounds; muriate of potash, 200 pounds; basic slag, 400 pounds. Total, 800 pounds. Furnishing nitrogen (all nitrates), 32 pounds; actual potash, 100 pounds; available phosphoric acid, 64 pounds; free lime, 183.2 pounds. Cost, nitrate of soda, $4.20; muriate of potash, $4; basic slag, $3; total, $11.20. Tons of hay per acre, four; selling price of hay per ton, $15 to $18; value of hay per ton over cost of fertilizer, $12.20 to $15.20.

A formula which Mr. Leavens said he was going to use is this: Grafton, 1903, per acre: Nitrate of soda, three hundred pounds; muriate of potash, 250 pounds; basic slag, four hundred pounds; total, 950 pounds. Furnishing nitrogen (all as nitrate), forty-eight pounds; actual potash, 125 pounds; available phosphoric acid, sixty-four pounds; free lime, 183.2 pounds; costing, nitrate of soda, $6.30; muriate of potash, $5; basic slag, $3; total $14.30.

If one dressing is to be made a year, he said, he would recommend Clark's formula; if more than one dressing, the formula he was using at present. (Grafton, 1903).

He spoke of the importance of lime to the soil. Many kinds of grass will not grow in acid soils. Wood ashes and quick lime are most commonly used. Wood ashes cost a little more, but it is easier to handle.

On a chart Mr. Leavens had a number of seeding mixtures which he said gave good results. They were as follows: Timothy, 22½ pounds; redtop, twenty pounds; red clover, six pounds; total, 48½ pounds. This he said was the heaviest mixture he ever used and required a good deal of top-dressing. Other mixtures: Timothy, sixteen pounds; redtop, sixteen pounds; red clover, eight pounds; total, forty pounds.

Timothy, fifteen pounds; redtop 7½ pounds; red clover, 7½ pounds; total, thirty pounds.

Timothy, 19.50 pounds; redtop, 15 75 pounds; red clover, 7.50 pounds; total, 42.75 pounds.

Timothy, 20 pounds; redtop, ten pounds; total, thirty pounds.

Italian rye-grass, eight pounds; orchard-grass, ten pounds; red clover four pounds; tall oat grass, eight pounds; tall fescue, ten pounds; total, forty pounds.

Redtop, thirteen pounds; orchard-grass, eighteen pounds; meadow fescue, nine pounds; red clover, four pounds; total, forty-four pounds.

COMMON SENSE Calf Feeder

awarded **Gold M...** at Pan-American Exposition. **The only Feeder** adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

Time Tells On Butter.

It tells a good deal faster if the company it keeps is not good. But butter goes through commission houses and stores, and associates with cheese and vegetables, absorbing flavors not its own. But you can preserve the purity of your butter if you wrap it in

PIONEER BRAND
Parchment Paper.

Without any smell or taste itself, it shuts out every foreign odor and keeps in its delicate, sweet flavor. A purely vegetable paper, made in any size or shape to suit your wants. We print your name or brand, as desired, on every sheet and guarantee it never to rub off or discolor its contents. Free samples which we are sending out never fail to interest dairy people in **Parchment Paper.** Write for them and ask for copy of our book, **"Better Butter."** Also free.

Rumely Engines

both as to traction and generating and supplying power, are typical of all that is best for threshermen. They are rear geared, gears are of steel, cross heads and slides are protected from dust, they are free from all trappy devices. Single or double cylinders, burn wood or coal, or direct flue for burning straw. Fit companions in the threshing field for the famous **New Rumely Separators.** Free catalogue describes all. Write for it.

M. RUMELY CO., La Porte, Indiana.

Something on Writing and Top-dressing.

ED. HOARD'S DAIRYMAN:—I write so scrawly that I don't mind when a compositor makes a few little errors like making me "cast" a load of hay from one field to another instead of cart it, but one of your compositors last week did worse than that. He made me say "damn." It is tradition in Connecticut that the old traveling tinker, when he struck a difficut job put a little dam of sand around the hole to keep the solder from running away, and when the work was done blew it away. It was worthless. If I thought the compositor mistook my writing, I shouldn't feel so bad, but I am suspicious that he thought I wanted to say "dam" and didn't know how to spell it.

Allow me to add a word to what I said as to top dressing.

Hon. T. S. Gold, for nearly forty years secretary of the Connecticut State Board of Agriculture, owns a farm that his father owned before him. He owns meadows, on ground sloping more or less but none level, that he does not know when were last plowed. As he tells the story "they have been foddered on and top dressed and occasionally Charles takes a bag of mixed grass seed on a horse, when there is snow on the ground and scatters a little over the meadow."

Mr. Gold says so far as he knows, those meadows never yielded more hay than they do now. If any one has succeeded in plowing in the manure made from feeding the crop grown on any piece of land and maintaining its fertility, I have yet to hear evidence of it, and I don't care whether the crop is used as a soiling crop, fed from a hay mow, or a silo.

I believe an acre of ground will keep a cow longer if a soiling crop or corn for a silo is grown on it, than if grass is grown, but I just as firmly believe that it is a case of buying fertilizers, or in few years' time, howl about the deterioriation of the soil. An acre of land that would pasture a cow left on it night and day indefinitely, could undoubtedly be made by thorough tillage to keep two cows for a brief period, and when it petered out, it would be just fit to abandon.

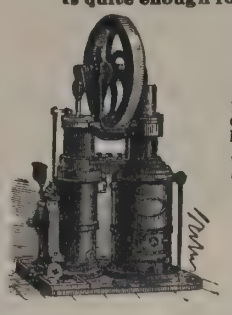
When brother Hale tells the orchardists that "tillage is a fertilizer," he is talking through his hat. Tillage enables the farmer to get out what is in the soil. It puts nothing back. R. S. HINMAN.

Stevenson, Conn.

The Manure Question.

ED HOARD'S DAIRYMAN:—I have been much interested in regard to the manure question. Farmers here in Vermont most of them have a manure cellar under their cows and shove the manure down through the scuttle into this basement and there it usually stays until spring when it is drawn out and spread where wanted and gives most excellent results, very much better then where piled in the field or spread on the ground as fast as made.

We have 42 cows tied over one of these basements and we can clean out for them in ten minutes and no cold draft let into the stable on a zero morning as there is when you take it out with a team.



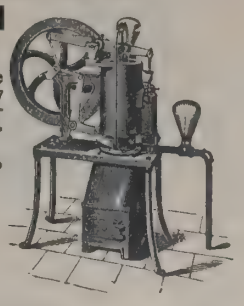
The practice of the best farmers is to clean out their manure cellars every fall and then draw in about a load of dry muck to each cow and spread on the cement under them. This holds all the liquids and when drawn out the muck is just as good manure as any part of it. It never heats and you cannot smell any more disagreeable smell in the stable then you could if the manure was not there. Here in Vermont it is not practicable to draw out the manure and spread it, as the snow has been four feet deep; now the snow is all gone but the mud is about as bad as the snow.

In those states where there is but little snow the drawing over the fields with heavy loads of manure when wet, must pack them and make it hard to get the soil fine and mellow again. I have heard farmers on Long Island say they should think it would kill cows to stand over such a mess of filth. I never knew of any injurious effects from it. Not long ago I saw a herd of 70 cows; standing over a cellar full of manure, that had made 347 pounds of butter to sell from each cow, and they are confined in the old fashioned rigid stanchion. Now brother farmers try a basement under your cows and be happy. R. S. D.

Williamstown, Vt.

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If



RIDER or ERICSSON HOT AIR PUMPS

Are used you can have water every day in the year, and your cook or stable boy is the only engineer needed. 25,000 in daily use. Catalogue "B 5" on application to nearest store.

Preserve Your Fences

sills, planking and all other woodwork that is likely to rot, by treating with

Conservo Wood Preservative.

It will pay you to use it on every stick of timber. Costs but a few cents a stick, and saves dollars in repairs, by preventing decay. It also kills germs and insects, and foul smells. We have studied wood preservation for twenty-five years, and believe Conservo is the best preservative that can be made. We *know* it is the best now made.

Send for circular, it costs nothing, and may save much.

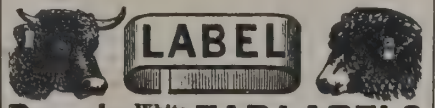
SAMUEL CABOT, Manufacturing Chemist, 80 Kilby St., Boston, Mass.

ILLUSTRATION.

THE 1903 KEMP MANURE SPREADER.

An implement of greatest value to the farmers is the modern manure spreader. We do not believe it is possible to urge too strongly its use. The value of the manure annually produced upon the farm is recognized, but too many farmers do not appreciate that a large part of its value escapes them by failure to spread aright. Manure may be made to go twice as far and secure better results from all the land when evenly distributed, than when thrown out in lumps and piles on limited areas to leach and wash away. We show here a type of what is best and secures the best results in manure spreaders. It is the original Kemp Spreader, manufactured by the Kemp & Burpee Mfg. Co., of Syracuse, N. Y., as it has been improved and appears on the market this year. This Kemp Spreader has for a number of years been the general favorite in many parts of the country. It has had much to do with showing the possibilities of spreading manure by machinery and securing the general introduction of the practice. In all kinds of manure, in whatever condition, as lumpy, coarse, fine, wet, filled with straw, corn stalks, etc., and in the spreading of lime, salt and every character of commercial fertilizer it has been accounted faultless at its work. With the latest improvements wrought out by the manufacturers in the machine of 1903 there is certainly nothing left to be desired. Not only is the manure torn apart, made fine and evenly distributed, and more immediate and better results secured, but the cost of spreading is materially reduced. From this consideration and taking into account the benefit to soil and crop, we believe it is no exaggeration to say that a Kemp Manure Spreader will pay for itself on the average well conducted farm in a single season. By its various attachments it is made to spread fast or slow as desired, to distribute broad cast or drill in single row or in two rows up to five and a half feet apart. the whole operation of spreading is controlled by the driver, from his seat, there being no occasion for dismounting from the time he leaves the stable until he returns for reloading. No adequate idea of the worth of this most useful machine can be given here. The Company's illustrated catalogue gives full and accurate information. We recommend to any one at all interested in manure spreaders to write for it. It will be gladly mailed free of charge.

Let Them Help Themselves.



They'll not take too much, and they'll get it as they want it. Don't force animals to eat salt when they don't require it, by mixing with food.

COMPRESSED

Pure-Salt Bricks

are all salt, no impurities. Improve the quality and yield of milk. A modern convenience, always present, animals never neglected, and costs for each only about a nickle a month. ELKHART CARRIAGE & HARNESS MFG. CO., Elkhart, Ind.

SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved

Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. **KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.**

Do You Want to Own a Gold Mine; to Grow Five Tons of Wheat Bran Per Acre?

Years ago, when J. E. Wing was first a cowboy and then a ranchman, in Utah, he sent his father in Ohio about a pound of alfalfa seed. The father was a farmer. Joseph had succeeded finely in growing alfalfa where he was and found it a wonderfully good feed for animals. He wanted his father to try it on the old home farm, and sent glowing accounts of what it would do for them, if it could be made to thrive. The father sowed the seeds on a small piece of land. Some time afterwards the son came home. After seeing his mother and father and sweetheart he went out where the alfalfa seed had been sown. His father saw him going and followed along. They came to the patch. The plants were small and sickly looking, with scarcely any leaves on them. The father said: "You see, my son, that your wonderful plant is no good here. It won't grow in this soil and climate." "Joe" says he felt about the same way, too, and was greatly disappointed.

Just then some hens came along. They marched through the little, weak alfalfa plants and picked off every leaf that had grown since they were there before. The father saw nothing, but the son said to himself: "Ah, may be success isn't so far away as we thought. Hens are very fond of alfalfa, and they have kept these plants stripped so they could not thrive. Now let us see about this."

He got an old barrel without any heads and put over one plant. This to keep the hens away from it, only. Then he brought about a barrel of water and poured around it, as it was a very dry time. Nothing was said to the father. In three or four weeks that plant was above the top of barrel, strong and thrifty as one could ask for.

Joe called his father. "There; see. Tell me alfalfa won't grow in Ohio." "Boy," said the old gentleman, "do you suppose I want to grow a crop that I must put a barrel around every plant in order to make it thrive? Away with your nonsense?"

Joe is a thinker and a man with a determined will. He said quietly to himself, if I can make one plant thrive, I can cover the farm with fields of luxuriant alfalfa; it fs only a matter of making conditions right all over. In this way was the first success made with alfalfa, and as a result probably more than 100,000 acres have since been put out.

The next year Mr. Wing sowed perhaps one-third of an acre. It did well. Then he put out about three acres more. This happened to be on three different kinds of soil. There was a dry, rich, gravel knoll, and some poor clay soil, and then a low, wet place. On the dry, rich land the alfalfa succeeded finely. On the poor clay the plants were small and spindling and evidently never would amount to anything. On the wet land the crop was a failure. And here the wonderful will power of the man shown forth. He said to himself, "All right; I see. I am not going to get alfalfa growing all over as soon as I thought, but never mind. It is coming. I will tile drain the wet places. I will manure the poor land and make it rich enough to grow the crop. Alfalfa I will have, and big crops of it, all over. He went to buying and hauling manure. About that time Terry was called to an institute in the town where Mr. Wing lived. He told what clover had done for him. Mr. Wing and his "sweetheart" (they were married then) came in. This was some thirteen years ago. Well does the writer remember this meeting in the basement of a church. Wing drank in every word. He said to himself: "That is the thing; I can't haul manure enough to enrich all this run-down land. Red clover will help me to get the land fertile enough to grow alfalfa." So he deserted his first love, almost, and strained every nerve, and his credit, too, in draining the wet land and making red clover grow. It takes richer land to start alfalfa. Soon he got acre after acre all dry and rich, and then great fields of alfalfa growing as told of recently.

What has this done for friend Wing? Don't you see? As he puts it, it has crowded all the poor land off his farm. It has crowded the line fences back until his farm is much larger. He says it is better than a gold mine; and it is a gold mine most any farmer can have if he will work as hard for it. The farmers in Mr. W's section are short of hay. As a result,

ARMOUR'S BLOOD MEAL Cures Scours in Calves.

First proved by the Kansas Agricultural Experiment Station, and since corroborated by thousands of leading stockmen who have used it without a single failure. Equally effective for the diarrhea of all animals.

PREVENTS weak bones, paralysis of the hind legs and "thumps" in pigs; "big head" of foals; "rickets" of all young animals; abortion due to incomplete nutrition, and a host of other troubles.

A Potent Food for Work Horses, Dairy Cows, Poultry.

Write us for booklet giving valuable information about **Blood Meal** and our other feeding products. Consult us free of charge regarding stock diseases.

The illustrations on this page are not only typical Holsteins but also examples of "dairy form" well worthy the critical study of every would-be successful dairyman. Further than this, and of considerable importance to all who contemplate investing in high-grade Holsteins, they are representative specimens of the animals to be included in the McGeoch sale at Milwaukee, May 6.

New York City Milk Supply.

Ed Hoard's Dairyman:—The problems relating to New York city milk supply are many and difficult. Greater New York, with its nearby cities, demands an immense amount of milk, and the supply must come from an extensive area. So great is the demand for milk that for several months every year very little butter is made in New York state, and similar statements may be made for each of the other four states from which comes the milk supply. The states are New York, Pennsylvania, New Jersey, Connecticut and Massachusetts. Of course there are many other large cities that draw their supply in part at least from the same states. Since the adoption of the Agricultural law in 1884 by the state of New York, other states have adopted similar laws, and the effect of their enforcement has been to secure for the cities a much purer article in the way of milk, cream, etc. Two or three other states antedated New York in the passage of laws tending to enforce a purer milk supply, notably New Hampshire and New Jersey.

It was shown in 1884 that of the thousands of cans of milk supplied to New York city, 20 to 40 per cent at least, was added water. Now watered milk is not in evidence to any extent, and the result is, that the consumption of milk per individual has increased to a wonderful degree. Add to this the increase due to increase of population, and the necessary supply becomes enormous.

When Gail Borden commenced the manufacture of condensed milk in 1856, after ten years of experimenting, he could have had no conception of the future magnitude of his enterprise. The condensed milk business is enormous, but in addition to that the Bordens control a very large share of the retail trade in "whole" milk in Greater New York and adjoining cities. It has been estimated as high as two-thirds, and the estimate appears to come from very good authority, but the writer of this article disclaims any personal knowledge of the matter. The Bordens have paid the farmers good prices and paid promptly. They have helped the farmers, by their rigid inspection, to improve their dairies and dairy buildings, and to improve their methods of handling milk and cows. They have been somewhat exacting, and some complaint has resulted. Perhaps an injustice may have been done some individual by an officious inspector, but the main result has been for the benefit of the dairymen.

At any rate, farmers have complained but little of the dealing of the Bordens with them, but have complained bitterly of some others with whom they have had occasion to deal. The question so far as their relations with the Bordens are concerned is, what will be the result when they control still more absolutely the milk and cream trade of Greater New York, as it is supposed they intend to do.

It is six years since the farmers undertook to organize by forming the Five States Milk Producers Association. They gained ground, so far as membership was concerned, for a time. Of late little active work has been done, but the members are not willing to admit that the spirit of the organization is in any way weakened. They gained by the experience they had, they learned something of the strength of their adversaries, and something of their own strength. They saw that they must have some means of caring for the milk besides forcing it upon the cities at an inopportune time. Largely, it is believed, because of this understanding, the farmers have been erecting co-operative creameries during the last three or four years, and now appear to own somewhere near one hundred and fifty within the territory from which comes Greater New York's supply.

A list of over one hundred of these has been compiled and now an effort is on foot to unite them into what is called the Co-operative Creameries Association. It was deemed advisable to complete that organization whenever properly accredited persons representing forty or more co-operative creameries, should sign the articles of agreement. A meeting has recently been held in Binghamton and the signatures secured up to the time of closing that meeting lacked only three of the requisite number. It is believed that the three, and others with them, will speedily be obtained.

This is but a continuation of the work undertaken by the Five States Milk Producers Association. There were present at the Binghamton meeting, delegates representing more than fifty co-operative concerns. The object of the formation of the association is set forth in the resolutions adopted: To increase the price of milk to the producer; to gain recognition; to organize co-operative creameries; to take care of the surplus milk.

The Bordens operate their own creameries, but buy some milk and cream of other concerns. The movement is not against them, though some think it may be wise to prepare for possible war in time of peace. The cause of the original movement was the oppression by the syndicate called the Milk Exchange, and by the railroads and other dealers. Of the wholesale price of milk, the farmer received considerably less than half, while the consumer was compelled to pay severel times more than the farmer received. Farmers believed they should get a larger share of the sum paid by consumers. Although better prices are now paid, it is not believed that the farmer yet receives his just share.

Six years ago it is not known that any other dealers paid as high as the Bordens. Last year the Milk Exchange price reached within one-eighth of their price, and many co-operative creameries paid more than the Bordens. It is claimed that the efforts toward organization have been largely instrumental in bringing about this improved condition. Right here appears to be a good place to suggest the ideas that Hoard's Dairyman has advocated so long. There is a demand for cream and butter that will, in many cases, prove remunerative, as has been shown already by many creamery concerns.

So long as New York milk trade does not make it an object to ship milk, and skim milk has so high a value on the farm, it would seem to be the part of wisdom for the co-operative creameries to handle the milk in such a way as to leave the skim milk on the farms. There can be few cases where skim milk should be sold at ten cents or even fifteen cents per can as is frequently done. The abuses and discriminations by the railroads may well be looked after by the Creameries Association, as is their avowed object.

Another object of theirs is certainly commendable. They will make an effort to have the Pure Food Laws enforced, and to prevent the partial skimming as they claim is now done with a large portion of the milk after it leaves the farmer's hands. If skimming could be prevented it is claimed that the demand for milk would at once increase, and ultimately there would result an increased consumption per capita, all of which would be of much benefit to the farmers.

The Oleo Trade.

Ed. Hoard's Dairyman:—The editor of the *National Stockman and Farmer*, is responsible for the statement that large quantities of oleomargarine are being sold in Pittsburg, but not as butter. As a matter of fact, the state authorities have never been able to stop the selling of oleo in that city, and while as the editor says, much of it is being sold under the law, there is no doubt much more of it being sold as butter, "under the rose." The oleo is being sold at 20 cents per lb., while butter is selling at 33 cents, and it is safe to assume that those dealers who have defied the law, with the courts upholding them, as our Dairy and Food Commissoner found, are not losing the rich opportunity to substitute 20-cent oleo for 33-cent butter.

Prof. Hamilton has left our Department of Agriculture to accept the more congenial position of Farmers' Institute Specialist, under the national government. The appointment of Prof. Hamilton secures an experienced and well equipped officer for the new position.

Dairy and Food Commissioner Cope will step out Mar. 31, and go back to the peaceful Brandywine in Chester county, as a plain farmer. Cope and Hamilton have been strenuous administrators in their pure food work. Senator Critchfield succeeds Prof. Hamilton as Secretary of Agriculture, and at the time of the writing of this, the successor to Mr. Cope has not been named.

HAY SHORTAGE.

A Pennsylvania correspondent writes me that their clover and timothy in the wheat was completely burned out last summer, and he is much concerned as to feed to take the place of hay for next winter and wants my advice. This condition seems to prevail in almost all sections of this state, judging from the letters I have received; and I will ask indulgence in my reply by suggesting that such conditions should lead to a remarkable movement in the building of silos so that dependence on dry forage for home consumption would be reduced to a minimum. Were part of the land, that fails now in promise of a hay crop, put in corn for the silo, and the remainder of it sown to some of the numerous summer catch crops, the regulation hay will be scarcely missed from next winter's feed supply.

A large part of the hay produced in state is timothy, and when we consider the time in the life of the plant at which it is usually cut for hay, and the selling value of it on our markets, it becomes a pretty plain proposition in agricultural economics that it should not be fed on the farm, but sold as a money crop, and the other crops that can be so abundantly and cheaply grown and that have no actual commercial value, used instead.

CATCH CROPS.

As a catch crop, or as a crop of great value and one not occupying the land during the growing season proper, and as one acting as a conservator of soil fertility during the wasting periods of fall, winter and early spring, it seems to me rye is very much neglected by the farmer and dairyman. Instead of allowing such land as I have not sown to crimson clover—say, ensilage land, where the corn grows too thick for the clover to do well, I sow to rye, two bushels to the acre, after a stirring of the ground by simply running the double corn cultivator astride the row of corn stubbles, and following with the grain drill.

With the seed I usually apply a dressing of acid phosphate and potash, and give the rye a light dressing of manure during the winter, while the ground is frozen. We begin to cut the rye for soiling as soon as the first heads show and continue to use for this purpose for about ten days, when the remainder is cut for hay and cured in large cocks, being raked and cocked as soon as wilted. Cut thus early it makes a magnificient hay and being cured in the cock, the green color is retained, as are also the natural flavors. I think our friend, Mr. G. W. of Philadelphia, Pa.,—Dairyman, page 142, will

secure much better results from this treatment of his rye crop than he will by ensiloing it. This hay will be made in May and a crop of corn follow.

CRIMSON CLOVER.

I have over twenty acres of very fine crimson clover growing, principally in corn stubble, from which the corn was cut and husked for a grain crop.

At this writing, March 20, a mat of green growth about four inches thick covers the ground and has surely performed the kindly office of taking care of the land during the bare days of winter. Some of this clover will be cut for soiling and some made into hay, but most of it will be plowed down for potatoes, oats and corn. The seed for this crop cost me less than one dollar per acre and it saves much and adds much to the land.

CORN HAY.

After the rye hay is removed, the land may be plowed and should be manured, and the manure well worked in during the process of thorough tilling, and corn planted for hay. If the very finest corn hay possible to have is wanted, Stowell's Evergreen or other large fodder sugar corn seed should be used, but much more bulk will be secured by using ordinary field corn. Not less than a bushel per acre of seed should be used. The sugar corn seed this year will cost from six to eight times as much as ordinary corn.

Drill in rows three feet apart, or wider if preferred. The object is to have the growth so thick in the rows that no ears will form and all the food value remains in the stalk. The stalks being fine the horses and cattle will eat it completely. Cut before fodder ripens and cure in shock.

COW PEAS.

If a more nitrogenous hay than the corn can be wanted, the rye can be followed with cow peas, about 1½ bushels to the acre, and hay of feeding value equal to any hay, grown and harvested. The vining habit of the cow pea makes it somewhat more annoying to harvest and handle, but if cured in windrows or cocks so its good values are retained, the cows next winter will fully repay for a little pulling and hauling while making the hay.

Cowpeas keep green long. The harvesting of them need not be hurried. I think this plant especially is one that as it nears maturity increases the value of its protein. Cut too early, the proteids have not become elaborated into a condition for perfect animal assimilation. At any rate, the cow pea is not a rusher at harvest time. By its time for being cut, usually some threshing of wheat has been done, and if into the hay mow a layer of cow peas is alternated with one of clean wheat straw, all danger of the pea hay molding will be overcome, the straw, which has really a valuable food composition, will partake of the flavor of the hay, and the quantity of feed will be largely increased. A hay knife should be used in taking hay from mow, when the peas and straw will be nicely mixed and certain strong expressions will be expurgated from the language of the individual who has cut the vines instead of trying to pull them out.

HUNGARIAN GRASS.

As a quick growing summer crop for soiling or hay, Hungarian grass on good land is invaluable. Its season is short and its yield immense if given feed enough. Quick growers are heavy feeders.

Many farmers have been disappointed in feeding Hungarian hay because it was not cut soon enongh. Many harvest it in the seed instead of in the blossom.

I like to haul in my clover hay with the bumble-bees following the wagon. I have seen too much Hungarian hauled in with the birds following for the seeds. From a Storrs' bulletin I make the following extracts:

GREEN FODDERS.

	Proteiu	*Potential Energy*
Oats and peas	3.5	290
Oats and vetch	3.6	440
Red clover rowen	4.7	440
Scarlet clover	3.1	365
Hungarian	3.1	500

CHESTNUT FOR SILOS.

Page 130, C. I. H. asks about chestnut for silos. I have a square silo, with cut off corners, lined with two thicknesses of one-half inch chestnut boards, joints broken, painted with gas tar, that I have used for eight years with no signs of decay. I prefer it to pine. I had boards sawed thin so they would dry out quickly when silo was empty. It will do equally well for staves.

W. F. McSPARRAN.

Further Figures Showing the Relation of Feed to Milk Products—Net Nutriment Required for Milk of Varying Qualities—Valuable Tables for Present Study and Future Reference.

ED. HOARD'S DAIRYMAN:—In bulletin 79 from this Station, it is shown that when cows have been in milk some considerable time, the net nourishment used by certain cows in the production of a lb. of butter fat was approximately 6.25 lbs. At the time the bulletin was put to press, we were well along in our feeding experiments for the winter 1902-3, and naturally were very anxious as to the outcome of this winter's work, and so lost no time in keeping our calculations very close to the work of the herd as it was reported from week to week. I have just finished the tables which are to be studied more carefully before the result is published. Indeed, it may be deferred until one or two more winter's work of the herd is completed.

The conduct of the cows was about the same this year as last and I am more than ever puzzled as to why cows on a wide ration seem to require less nutriment to a given product than on a comparatively narrow one. There is no conflict in the results obtained this and last winter, except that it required more nutriment to a given product, but the cause seems quite plain. This year it required 6.74 pounds of nutriment, available for propuct, to a pound of butter fat, which is practically half a pound more than the amount stated in bulletin 79. While it was stated that more was required with cows giving milk containing a low per cent butter fat, the inference would naturally be that it required 6.25 pounds of net nutriment to a pound of butter fat with average milk. Such is really not the case, and the primary object of this communication is to make a little explanation.

The cows' records employed to make the illustration gave milk testing better than 5 per cent butter fat, and the nutriment required to a pound of butter fat had special reference to milk of that quality. In making further study in regard to the nutriment required in the production of a pound of butter fat with cows giving milk of different grades, it appears that the requirements are approximately as follows:

Milk testing	*Net nutriment to 1 lb. butter fat.*
2.5 per cent fat	8.5 lbs.
3.0 " " "	7.8 "
3.5 " " "	7.3 "
4.0 " " "	7.0 "
4.5 " " "	6.6 "
5.0 " " "	6.4 "
5.5 " " "	6.2 "

From this it is shown that for milk of medium quality—4 per cent butter fat—it requires about 7 pounds of net nutriment to a pound of butter fat yielded.

During the feeding experiment, this winter, a composite sample of each cow's milk, covering 14 milkings, was subjected to a complete chemical analysis, to enable a closer study of nutriment taken in and the character of product yielded. The composition of the various grades of milks as revealed by the chemist shows why it requires more nutriment to a pound of butter fat with the lower grades of milk.

Per cent fat in milk.	*Solids not fat to 1 lb. butter fat.*
2.68	2.85
3.19	2.35
4.09	2.07
4.10	2.02
4.22	1.97
4 57	1.86
4.59	1.86
4.61	1.90
5.28	1.87
5.33	1.64

From this it is seen that with 4 per cent milk, cows produce to each pound of butter fat, about two pounds of milk solids-not-fat, while in the milk testing 2.68 per cent fat there are 2.85 pounds of solids-not-fat, to each pound of butter fat, and in the milk testing 5.33 per cent fat there were only 1.64 pounds of solids-not-fat, to each pound of butter fat, and since it requires nutriment to produce the extra amount of solids-not-fat found in the lower grades of milk, which must of necessity be charged to the butter fat, it makes it more expensive as the quality of the milk decreases. When the total milk solids, however, are made the basis of calculation, it is produced cheaper in the milks carrying a low per cent butter fat.

Referring to a recent letter from the associate editor wherein the belief is expressed that cows should be fed according to the butter fat they yield, it will be seen, from what has already been submitted, that such a method would not meet the requirements, because cows differ as to nutriment required to a pound of butter fat, as has been shown, and the following table shows that they also differ as to protein required.

Table showing per cent fat and protein in milk of individual cows, and protein in the milk to a pound of butter fat:

In 100 lbs. of milk.		*Protein to 1 lb. Butter fat*
Fat.	Protein	
2.68	2.63	.982
3.19	2.44	.765
4.09	2.88	.704
4.10	2.69	.656
4.22	2.81	.668
4.57	2.94	.643
4.59	3.50	.762
4.61	3.10	.672
5.28	3.88	.734
5.33	3.42	.641

From this it is seen that while individual cows differ somewhat in regard to the relation between the fat and protein in their milk, there is a general decrease in protein to fat as the milks increase in quality. In the milk that contained 5.33 per cent fat there was only .641 of a pound of protein to a pound of butter fat, while that containing 2.68 per cent butter fat required .982 of a pound of protein to a pound of butter fat, being 50 per cent more than there was in the milk containing 5.33 per cent butter fat.

To show what generous provision is made for the increase in protein required as milk increases in quality, in table XXVI on page 104, bulletin 79, I submit a few illustrations showing the test to the nearest tenth of the foregoing table, the protein in the milk to one pound of butter fat, and the amount of protein provided in the table for milk of similar quality:

Per cent fat in milk	*Protein to 1 lb. fat in milk*	*Protein provided to 1 lb. fat in milk*
2.7	.982	1.392
3.2	.765	1.284
4.1	.704	1.156
4.2	.668	1.145
4.6	.643	1.106
5.3	.641	1.053

This shows that even the standard tentatively submitted provides net protein for milk production 62 per cent in excess of the protein found in the milk. This indicates that if there is any change to be made in the standard submitted it will certainly not be in an increased protein supply, nor is it practicable to make either yield of milk or butter fat only a basis.

It may be of interest to know the net protein in the ration fed to one of the groups of cows this winter and the protein found in the milk. The daily ration contained on an average 1.239 lbs. of digestible protein; the average weight of the ten cows was 825 lbs.; the protein for maintainance is calculated at .578 of a pound (.7 for 1000 lbs. live weight.) leaving .661 available for product; and in the daily product there was on an average .621 of a pound of protein—leaving only .04 of protein daily unaccounted for. The milk tested 4 per cent fat and there was .74 of a pound of protein in the milk to a pound of butter fat.

If a wide ration causes a depression in the digestibility of the protein, as has been suggested by some, how did these cows manage to account for all the protein in the food except the small amount of .04 of a pound? The only answer to this question is that either this was an exceptional case and, under the methods of feeding followed, there was no decrease in digestibility of protein in the wide ration, or that these particular cows required only .5 of a pound of protein daily for maintainance per 1000 pounds live weight. (.426 for a cow weighing 825 lbs.) This would leave daily .826 pounds of protein available for product, and since there was daily .621 of protein in the milk, .205 of a pound, or 24 per cent, of the protein was not accounted for. In either case does not the cow become entitled to the degree of Producteur Economique. Why not award degrees to the cows? They do the most imporant part of the work. What an encouragement to heifers if the old bossy grandees were decorated with appropriate titles; Sweet Briar; Ph.D., Houston, M. A., for instance. What has a cow an escutcheon for, anyhow, if not to have emblazoned thereon, the titles appropriate to her attainments.

NATIONAL Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitab than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each ..	$4 00
No. 2,—4 bottle, complete for testing milk.... each	5 00
No. 3,—2 bottle, complete for testing cream and milk, each	4 50
No. 4,—4 bottle, complete for testing cream and milk, each	5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

The Lack of Equipment in Dairying.

ED. HOARD'S DAIRYMAN:—One of our western New York dairymen the other day preached a long sermon to me on the dairy situation as he conceived it to exist with him and his fellow farmers in their effort to make money out of milk. He did it in these few words: "We lack the equipment."

Of course he said more in explanation of the situation, but this phrase is enough to show his grasp of the difficulty. There are a good many reasons leading up to this confession. Some of them apply to this herd, some to another, while some are guilty of most of the drawbacks that have to do with poor success in dairying. I am not now living on a Western New York dairy farm, but I have done so long enough to appreciate the situation, and also to enable me to see that the difficulty in the main is made up in two ways. One is lack of sufficient faith in what one does to put energy and money enough into it to insure success. The other is a lack of what may be called alertness. Following the old line is easy. Taking up a new one is hard. Besides it does not always succeed, at least at first, and we are either not willing or not able to risk failure that we may profit by it.

It is not the man who seldom or never fails who is sure of the greatest progress. It is the man who knows how to profit by his experience and does it, whether he succeeds or fails to begin with. Western New York has in former days made money easily and fast out of grain and fruit. Now that this is no longer easy, the dairy has been set up as a helper, and as a rule it has not been thoroughly done. There is the milk dairy as a short cut, a very necessary industry in this vicinity of large cities, but one that can be made a very shiftless business if the "right" man gets hold of it.

For instance my friend tells me of a neighbor who is carrying a single can of milk a day to the railroad, several miles over roads that have been at their very worst since February and are not likely to be much better for a month yet. As this man works his land on halves he is getting not over 40 cents a day for his half of the milk he sells. Could anything be less inviting? Yet it is a reasonable certainty that he imagines he is the victim of circumstances and is spending the time that should be given to study and observation of his business to cursing his luck. Ask him if he reads agricultural or dairy papers, and he will say that he has no time for them. A farmer of long standing, who does not make a quarter of the money now that he did 25 years ago, said this very thing to me this week when I told him that I had so much interest in farm affairs and saw so many unsolved problems in them that I was reading about all the farm papers I could get.

Really, what is to be done to get the literature of the farm into the hands of the farmers? There is no greater problem in farm affairs than this and I am afraid there is none more hopeless. I firmly believe that half a dozen live papers, not merely in the house, but in the hands of any reasonable farmer would fire him up as though a match were set to tinder. The trouble is that he fights shy of them all and if he takes a single one he does so as a favor to some friend who is selling it, and seldom looks at it.

Not long ago I asked an old farmer if a certain change of method of raising a certain crop would not be likely to double it and he agreed that it might. I then make bold to ask why he did not adopt it and he replied that "we always did it this way." The reason was sufficient, and I said no more.

There is really nothing new on the dairy farm in this vicinity that I have been able to discover but the silo, and the spread of this has been due largely to the activity of agents, who differed from the lightning-rod man of old in having something worth buying. "Every farmer who did not have a silo last year is buying one now," was the report of a silo builder the other day. This is all well enough, but like almost everything else, it is only part of the case.

Dairy farming is a taxing business. It keeps us at home morning and evening every day, but it makes the farm and with prices such as they have been of late, it will make us if we attend to business intelligently. Let nobody forget the one word "equipment,"—good cows, proper feed (raised and not bought, as far as possible) good quarters, good handling, a fair amount of modern appliances. How many of us are covering this ground? If we do not why should we complain?

Erie Co., N.Y. JOHN CHAMBERLAIN.

Cow Peas and Soy Beans in Wyoming Co. New York.

ED. HOARD'S DAIRYMAN:—On page 153, J. N., Wyoming Co., New York, asks if any one in Western N. Y. has tried cow peas or soy beans and found them a success. As I spent forty years of my life in Wyoming Co. and have grown cow peas and soy beans for several years in Va., perhaps I can give some advice that will be useful to the farmers of Western N. Y. I am quite sure that both crops can be grown successfully in that part of the state but believe that the soy bean will give the better satisfaction and that the best use to put it to would be to put it into the silo along with corn, and that the best way to grow it, provided the harvesting can be done satisfactorily is to grow it in alternate rows with silage corn, making the rows about 32 inches apart. I have grown it in that way for two years with field corn and get half a crop of beans and nearly a full crop of corn, and with a riding cultivator can straddle the beans after the corn is tasseled out.

The corn being a surface feeder, has nearly the whole surface to itself, as the bean is a deep rooting plant and the corn being farther apart gets more benefit from the sun and air. I raise a tall growing, yellow variety of bean which can be cut with mower, reaper or binder, and if planted with silage corn will be ready for the silo at same time as the corn. If planted by itself it can be planted two or 2½ feet apart using one peck to one-half bu. of seed to the acre. It would make a splendid crop for sheep or horses, if cut with binder when grain is about mature and just before leaves begin to turn yellow.

It yields much heavier in grain than cow peas and no amount of bad weather will injure the grain when ripe, but very little will injure cow pea. But the bean must be thoroughly dry before storing in bulk either threshed or unthreshed. The bean can be planted as early as corn and will stand cold, wet weather that would ruin cow peas. It will also stand as much dry, hot weather as the cow pea. It never falls down or lodges from wind or rain. I believe the soy bean will solve the protein problem for the stock farmer.

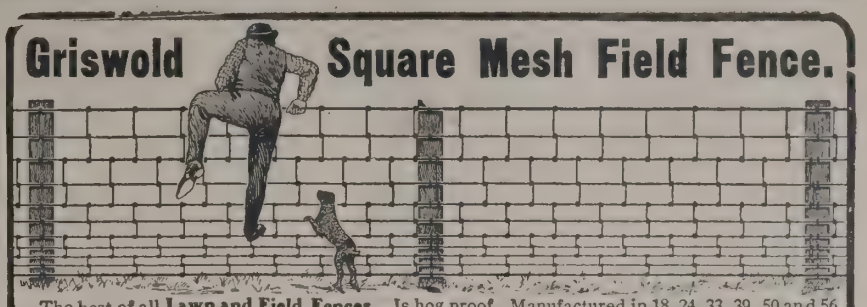
BUILT OVER.

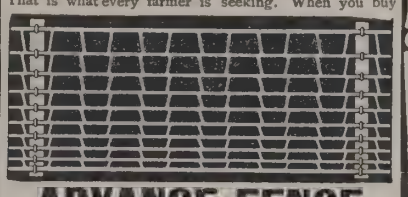
Food That Rebuilt a Man's Body and Built It Right.



By food alone, with a knowledge of what food to use, disease can be warded off and health maintained, also many even chronic diseases can be cured. It is manifestly best and safest to depend upon food to cure rather than too much drugging.

A case in point will illustrate. A well known man of Reading, Pa., Treas. of a certain club there, says: "I have never written a testimonial letter but I have been using Grape-Nuts about a year and have recovered my health, and feel that I would like to write you about it for the case is extraordinary.

"For five years I was a sufferer from a dreadful condition of the bowels; the trouble was most obscure." Here follows a detailed description and the condition certainly was distressing enough (details can be given by mail).



"Nothing in the way of treatment of drugs benefitted me in the least and an operation was seriously considered. In May, 1901, I commenced using Grape-Nnts as a food and with no idea that it would in any way help my condition. In two or three weeks time I noticed an improvement and there was a steady gain from that time on until now I am practically well. I don't know how to explain the healing value of the food but for some reason, although it has taken nearly a year, I have recovered my health and the change is entirely attributable to Grape-Nuts food, for I long ago quit medicine. I eat only Grape-Nuts for breakfast and luncheon, but at my night dinner I have an assorted meal." Name furnished by Postum Co., Battle Creek, Mich.

Griswold Square Mesh Field Fence.

The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. Plain, Galvanized, Barbed or Telephone Wire. Wire Nails and Hay Bale Ties.** Write for illustrated catalogues and price lists. **Dillon-Griswold Wire Co., Sterling, Ill.**

We Make Honest Fence
AT A REASONABLE PRICE.
That is what every farmer is seeking. When you buy

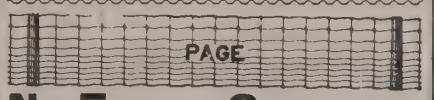
ADVANCE FENCE
you get a good fence at the price of a poor one. The hand fence machine can't compete in price and quality.
WE SELL DIRECT TO THE FARMER AT WHOLESALE.
That saves you the dealer's profit. It's all interwoven, no loose ends to unravel, ruining fence. Cross wires can't slip. Our prices are as low as can be made for a good fence. Your name and address on a postal card will bring circulars and special prices. Write at once.
ADVANCE FENCE CO., 126 R ST., PEORIA, ILL.

SILOS SAVE the entire crop in the best feeding form. Ours are all round. No corners nor angles to admit air and mould and rot the silage. We make them of Cypress, White Pine and White Hemlock. Four styles and 200 sizes. Fit every requirement. Nothing so good, nothing so cheap. We make all kinds of machinery for filling Silos. Catalog free.
Harder Manufacturing Co., Cobleskill, N. Y.

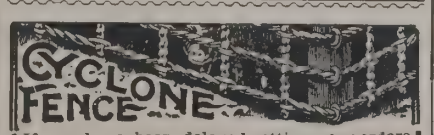
The
Economy Silo
Made of selected lumber, by skilled mechanics and special machinery. Continuous hoops—airtight—the best and cheapest. Write for illustrated catalogue and information.
ECONOMY SILO AND TANK CO.
1814 Market St., Philadelphia, Pa.

BROWN
16 to 35 Cents Per Rod.
Heaviest, strongest, most durable fence made. All wires extra large. We sell to Farmers at Wholesale Prices. Coiled Spring, Barb and Soft Galvanized Wire.
WRITE FOR CATALOGUE
The Brown Fence & Wire Co.
22 Rose St., Cleveland, O.

ROUND SILO.
...THE...
"PHILADELPHIA"
The only Perfect, Continuous Open Front Silo made. See open top patent roof. Ask for catalogue.
E. F. SCHLICHTER,
321 Vine St., Philadelphia, Pa.
Also made in the West by
DUPLEX MFG. CO., So. Superior, Wis

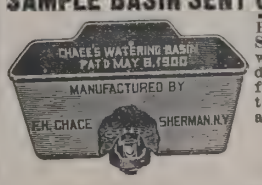


FENCE We'll tell you the cheapest and best way to build it. Of **any kind of wire**, for any requirement, with cheap labor, no machine and we'll tell you how to **fix your old fences too.** Write
B. B. FENCE CO., 1345 Clark St. RACINE, WIS.



THE BEST FENCE
Can be made at the actual cost of wire. Over 100 Styles, and 50 to 70 rods per day. Horse-high, Bull-strong, Pig and Chicken-tight.
THE DUPLEX MACHINE
makes it. The Machine is Automatic, simple in construction, runs easy, works rapidly. **Sent on Trial.** Plain, barb wire and Gates at wholesale prices. Catalog free.
KITSELMAN BROTHERS,
Box D68 **Muncie, Indiana.**

FENCE! *STRONGEST MADE.* Bull Strong, Chicken-Tight. Sold to the Farmer at Wholesale Prices. Fully Warranted. Catalog Free.
COILED SPRING FENCE CO.
Box 103 **Winchester, Indiana, U. S. A.**



No Fence Company
beats our prices on the same quality of fence, because they never make our quality.
PAGE WOVEN WIRE FENCE CO., ADRIAN, MICH.

If you have been delayed getting your orders filled for "wire fence" or "fence wire" wire us your hurry orders. We have three well stocked Houses.
CYCLONE FENCE CO.,
Holly, Mich. Cleveland, O. Waukegan, Ill.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

THE dairyman who thinks that the Oleo makers are going to stop coloring oleo without making a vigorous attempt to find a method that the law will not forbid, is very much mistaken. Ever since the law was passed all the skill of some of the best chemists in the country has been at work on the question of finding a natural color for oleo. At one time palm oil seemed to furnish what was wanted, and a color that the analyst could not identify. But what one chemist puts together another one can usually pull apart, and a method of identifying the palm oil color has been found, and the successful manufacture of colored, untaxed oleo is still in the distance.

THE Ninth Biennial Report of the Minnesota Dairy and Food Commissioner, Hon. W. W. P. McConnell, has been received at this office. It is a volume of 392 pages and is filled from beginning to end with interesting and instructive matter.

The people of Minnesota are dealing with the food swindler and adulterator of all kinds, without gloves. The Commission is given a large appropriation, if we remember correctly $18,000, and employs a dozen or more inspectors whose time is taken up in looking after parties who sell adulterated food of any kind, spices, vinegar, impure milk, butter, or oleomargarine colored to resemble butter.

The report gives the names of over 700 milk producers selling milk in cities whose stables and premises have been inspected. There is also a record of a host of cases, where the names of parties are given who have been prosecuted and fined for selling adulterated food.

Among other cases are the names of several creamery men and butter makers who have been fined for under reading the Babcock test. This is square justice and the DAIRYMAN believes it would be in the line of dairy progress if some such examples were made in other states.

LIQUID MANURE.

On page two of the current volume of the DAIRYMAN was published the following question:

Will you or some reader give me a little advice which I need in regard to liquid manure. I find that under the cow barns, on a farm purchased by myself last year, are two cisterns, 7 ft. wide, 50 ft. long and 5 or 6 ft. deep, filled to overflowing with full strength liquid manure. I know not how long it has been accumulating, but concluded, after my discovery, that although a good deposit, it had better be put out where I can realize something from it.

Which will be the best thing to do, retain these vaults or fill them and save the liquid by absorbents? A. B. C.

East Onondaga, N. Y.

In reply we stated that applying manure in the liquid form is too expensive to be practical and that it would be cheaper to use absorbents in the future.

Our correspondent also wrote to the Rhode Island Experiment Station and received the following reply:

I believe it is better economy to apply the liquid manure by itself than it is to use absorbents. In either case the object is the removal of the liquid manure and its application to the land in such form as to be most effective. If the liquid manure is applied alone there is no reason why as much of it as can be hauled by a team at once may not be drawn out, if a suitable conveyance is at hand in which to carry it. If absorbents are used they must be hauled to the stable, scattered about and then the absorbent material as well as the liquid manure must be hauled away again so that, according to the advice given by HOARD'S DAIRYMAN, there is a very great additional amount of hauling and consequent additional expense where absorbents are employed.

Of course there is no question here as to the value of liquid manure. Its value is too well known to admit of any question, and it resolves itself into one of expense and convenience. Of course a tank of the above size, filled with fermenting liquid, is not the sweetest thing to have in the neighborhood, where milk is produced, but the important question is the relative expense of absorbents vs. handling some 3,000 lbs. of liquid, per cow, with a tank. As in most cases the absorbents used are largely derived from horse manure and waste food, which must be handled and drawn out, this question is reduced to its lowest terms and is not an important consideration. Unless there are local conditions under which the use of liquid manure would give large returns, we still consider that it would be cheaper to use absorbents.

TWO GOOD DEFINITIONS.

One of the most important things in this world to secure is a right outline or definition of the things we wish to do. A hazy, indefinite idea or concept in the mind, is sure to end in an imperfect, botchy way of doing. This thought is not entertained by men as much as it should be. It really constitutes the foundation difference between skilled and unskilled labor; between efficiency and inefficiency; between men of value and of but little value. It is an old saying that "A first class hired man will make a successful farmer." In many instances have we heard a shiftless, worthless farmer spoken of as having been a poor hired man." A disorderly mind, a lazy shiftless habit of thinking, invariably precedes the same way of doing things.

We hear much said about the art, as well as the science of agriculture. It is well to have a clear definition of these two things in our minds.

In bulletin No. 104 entitled "Modern Dairy Science and Practice", edited by Prof. L. L. Van Slyke, and issused by the Agricultural Department of Pennsylvania, we find the following clear definitions of the Art and Science of Dairying:

"Dairying is both an art and a science, whether considered in its restricted or broad sense.

"*The art or practice of dairying* embraces certain practices and processes which have been gradually developed by experience and observation. The art of dairying, in its widest application, teaches how to cultivate the soil for the production of certain crops; how to make and use fertilizers; how to breed, feed and care for dairy animals for the production of milk; how to produce cream, butter, cheese etc., from milk."

This is an excellent definition as far as it goes. One more very important thing should have been added, that of the construction and management of dairy barns and stables,

He defines the Science of dairying as follows:

"*The science of dairying* embraces a collection of the general principles or leading truths arranged in a systematic order relating to the operations of dairying. Thus, among other things, the science of dairying *explains* the growth of animals, the relations of foods to milk production, the chemical composition and physical properties of milk and its products. It consists of an application of the truths of such sciences as physiology, chemistry, physics, botany etc., to the *practical* operations of dairying."

It will be well for every dairy farmer to get those two definitions well set in his mind. He may become somewhat conversant with the art of dairying without knowing much of its science. He may have learned how to do certain things without having learned any thing of the principles that underlie them. How much more effective will every man become in the work of dairying if he strives to know the *why* or the science of the thing, as well as the *how* or the art of doing it. To know *why* we do a thing is a constant guide in doing it, as well as a guard against costly mistakes.

MILK—ITS USE AS A FOOD.

In the *Chicago Record Herald* of Jan. 13th. appears a very interesti ng an instructive article on "The High Value of Milk As An Article of Diet" by Dr. W. R. Latson, Editor of the *Health Culture Magazine* of New York.

The article is much too long for reproduction in the colums of HOARD'S DAIRYMAN but it contains many ideas and statements which are of value in showing what are the latest conclusio ns of medical science concerning milk.

Dr. Latson commences by revie wing the opinions which have been advanced both for and against the use of milk as a food by adults and the facts he brings out are of value.

He states the chemical composition of milk as follows:

"The composition of cow's milk of fair average quality may be roughly represented by the following formula:

	Per Cent.
Fat	4.00
Sugar	5.00
Proteids	3.30
Mineral matters	0.70
Total solids	13.00
Water	87.00
Total	100.00

We quote farther as follows:

"The most important food elements, perhaps, in the milk are the albumins or proteid ingredients. The greater part of these elements are in the form of casein, or, as it is sometimes called, casinogen. Other albuminons matters found in milk are lacto-protein, fibrin, lact-albumin, and lacto-globulin. The two last named albumins are coagulated by cooking."

It is the custom of many house wives to cook many articles of diet in milk. The cooking of milk as the Doctor states coaguiates the albumins and renders them indigestible. The further effect of cooking on the mineral content is described as follows.

"The mineral matters of milk are also important — more important, many claim, than the proteids just named. The mineral matters consist of phosphates and chlorides of potassium, sodium, lime and magnesium and traces of iron and other metals. Many, if not all, of these important mineral elements are found in chemical combination with organic elements. For instance, the calcium probably exists only as a phosphate with the casein, and the magnesium in combination with citric and other organic acids. The effect of cooking upon these substances is to break up the combination between mineral and the organic elements, causing the mineral to become "free." This is a most important point, and will be referred to later.

The sugar present in milk, lactose, is peculiar to that substance, being found in no other connection. When treated beyond a certain temperature it undergoes radical chemical changes."

The butter fat he states is little affected by cooking.

In describing the instruments in use to determine the quality of milk, the author mentions the lactometer and the creamometer, the latter being nothing more than the old-fashioned cream test glass tube. Strangely enough he says nothing of the Babcock test, an instrument of the highest merit in determining the fat content of milk, whereas the creamometer is of but little real use. It hardly seems if true that Dr. Latson is not aware of the superior, practical value of the Babcock test over the ordinary test tube in determining the per cent of butter fat in milk.

The following statement showing how the food and the conditions surrounding the mother, whether human or bovine, affect the quality of the milk is of value:

"The variations in milk depend upon the food of the animal, upon its state of health, upon its activities, upon the time and manner of its milking and upon other conditions. If the food of the animal be improper or deficient the milk is necessarily affected. According to a well-known German chemist, a sample of milk derived from cows fed on distillery refuse yielded nearly 1 per cent of alcohol. Another case is still more striking. A certain infant, cared for by a wet nurse, was seized with alarming convulsions every Monday and Thursday. On other days the child seemed to be in good health. On investigation it was found that the wet nurse during her "days out," which were Sundays and Wednesdays, was in the habit of taking alcohol freely. The servant's drinking of alcoholic liquors was stopped and from that time the child had no more convulsions. Many physicians can testify to the appearance of symptoms in the nursing infant resulting from drugs given to the nursing mother. Indeed, physicians have at times administered drugs to the mother for the sake of their effect upon the nursing child. Many other instances might be cited of the effect of bodily states upon the milk, but enough has been written to show that the character of the milk is intimately affected by the physical state of the animal from which it is derived.

Not only, however, as to the health of the cow, but regarding the handling of the milk is there danger of the milk being so injured as to make it unfit for use, or even dangerous to health. All the necessities in this respect may be embraced in one word—cleanliness. The teats of the cow, the hands and person of the milker and the various utensils in which the milk is conveyed from the cow to the consumer—all these should be absolutely clean."

The doctor then takes up the sterilization and pasteurization of milk and states that they must of necessity make milk indigestible; that if milk is clean it is a great deal more wholesome and nutritious to both infants and adults in its raw state. His ideas are evidently in keeping with those of the most experienced physicians in all of our cities for the great effort now is to produce milk of the highest purity without pasteurization, as do the Walker Gordon people, H. B. Gurler of DeKalb, Ill., and many others. There is one phase of this question however that the Doctor does not discuss, that is how to

make certain dairymen understand what the word "cleanliness" means.

Take a farmer, for instance of dirty ideas, and although his cows are plastered with manure and his milk filled with manure, dust and filth, he will tell you "it is clean enough." How shall we get down through the ignorance and stupidity of such cow keepers, and make them see that they have nasty ideas about a business that calls for the very highest cleanliness?

Concerning the injurious effects of cooking milk he farther says:

"It will be remembered that in discussing in the earlier part of this paper the various food elements contained in milk, it was stated that all the salts, part of the proteids and the sugar of milk, when subjected to cooking, underwent certain radical changes. The salts became separated from their organic combinations, some of the proteids were coagulated and the milk sugar was decomposed. Now with regard to these changes, it may be said, without going into detail, that the coagulated proteids are entirely indigestible, and that the "free" mineral matters resulting from raising the temperature of the salts and the decomposed lactose are not only quite unassimilable, but are actually irritant substances in the body. So, in the effort to kill the microbes by cooking, the only result is to kill the milk. When we cook our milk we kill it."

He states that raw *clean* milk is of the highest value to adult men and women, and particularly to invalids and persons suffering from lack of nutrition.

It must be taken in its natural state.

"Then, milk should be taken only with other natural foods in a natural state. Milk may be combined with uncooked eggs or cereals or with raw fruits, nuts or salads. It should not, however, be taken with ordinary cooked foods, as in such case it is certain to ferment, producing auto-intoxication, popularily recognized as "biliousness," and other disagreeable symptoms.

One who is undeveloped, thin, emaciated, may by the free use of milk and eggs, with such other natural foods as mentioned above, restore his or her body to full contours, and will at the same time experience a sense of well being and capacity which is possible only when the body is in a high state of nutrition.

The secret of cure, whenever cure is within the bounds of the possible, may be expressed in two words—nutrition and elimination. Milk is a perfect nutrient, and at the same time, because of the water in it, a great aid to elimination. For those suffering from an acute condition, an absolute fast should be imperative. For the weakly, however, and for those whose bodies, while, perhaps, strong and active, are thin, undeveloped or under-nourished, a diet of milk with fruits, nuts, cereals, salads and eggs, all eaten in their natural state—such a diet will effect a change both radical and lasting.

The dairy farmer can learn much from the above if he will. He can learn why the consumer demands so imperatively that the milk be good and absolutely clean. He can learn why the state of public sentiment is crystalizing in law and every other way against the man who will not keep his cows in a healthful condition. If he will see through this and beyond, to his own pocket, he will see that all these demands of science will pay him if he will obey them.

THE DIFFERENCE IN MEN.

The other day a California man wrote us a most woeful letter about HOARD'S DAIRYMAN—said he could not make anything out of it. We felt sorry for him, but really we could not see how we could help a man that was that far gone. It is evident there is a difference in men in California, as well as in other states, and here is a letter to prove it:

ED. HOARD'S DAIRYMAN:—In regard to the DAIRYMAN allow me to say that I consider it the best paper published in the interests of dairymen. My experience as a dairyman is, I consider, very limited, considering the vast requirements of the business. I began with only two cows two years ago last November. I knew nothing of the business and was free to admit I was green. True, I could milk a cow, pitch hay to her and give her water, but that is only sufficient knowledge for the primary department.

I wanted instruction as to advancement and I wanted it from men of experience, men who had made a success of the business. I at once subscribed for several farm and agricultural papers. I found them to be very good, but they were for a "general purpose."

What I wanted was something more detailed for dairymen. About a year ago I was in G. G. Wickson's supply house in Los Angeles, and there I got a copy of HOARD'S DAIRYMAN. I can say after a year's trial that it is just what I want and what hundreds of others need. I am now milking 20 cows and expect to get more this coming summer. HOARD'S DAIRYMAN is my senior partner in the business. CHAS. M. KIGGENS.

Sawtelle, Cal.

The Annual Meeting of The American Guernsey Cattle Club.

ED HOARD'S DAIRYMAN:—The Annual Meeting of The American Guernsey Cattle Club will be held at the Fifth Avenue Hotel, New York on May 13th at 10:30 a. m.

The year just closing is the 25th since the establishment of the Register and organization of the Club, and has been a very successful one for Guernsey interests.

Wm. H. CALDWELL, Secr'y.

Peterboro, N. H.

Some Questions Concerning Alfalfa Answered.

The first is, when to commence cutting? Our own experience is that the largest gain is made when the alfalfa is cut as soon as the first blossoms appear. If we delay beyond that period, two things are sure; the stalks get coarse and woody, and the second crop is much lighter. On this point, Prof. P. Harcourt of the Guelph Ontario College has made some comparitive experiments. He says:

Because lucerne (alfalfa) has such a thick, juicy stem, it is a little hard to cure as hay. To get the best results, it must be cut earlier than clovers. The determinations which the writer made in 1897-8 (Bull. 111, O. A. C.), on the composition and digestibility of lucerne, showed clearly that the most nutriment was obtained when the blossom was just beginning to open. This is shown in the accompanying table:

SECOND CROP, 1897.	Dry matter Lbs.	Digestion co-efficient.	Digestible matter lbs.
First cutting, buds formed	3197	58.6	1873
Second cutting, blossom one-third out	3819	56.2	2146
Third cutting, a little past full bloom	3317	51.3	1701
FIRST CROP, 1898			
First cutting, buds formed	3045	58.6	1784
Second cutting, blossom one-third out	4201	56.2	2389
Third cutting, a little past full bloom	3894	51.3	1997
SECOND CROP, 1898.			
First cutting, buds formed	1899	58.6	1112
Second cutting, blossom one third out	2505	56.2	1407
Third cutting, a little past full bloom	3214	51.3	1135

I was told by an officer, who went through the whole of the late war in South Africa, that the best hay they got there was made in the Argentine from lucerne.

The second question is, How does alfalfa compare in feeding value with clover and timothy? We consider it, at least, four times as valuable for milk making purposes and more than double the value of red clover.

The following table of analyses will throw some light on this point:

PERCENTAGE COMPOSITION OF LUCERNE, RED CLOVER AND TIMOTHY HAY.

	Water	Dry matter	Protein	Fat	Nitrogen free extract	Fibre	Ash
Lucern	15.00	85.00	13.20	2.98	35.42	27.25	6.15
Red clover.	15.00	85.00	11.47	2.04	41.31	28.63	6.55
Timothy	15.00	85.00	6.03	1.70	45.22	28.31	3.75

AMOUNTS DIGESTED PER TON OF HAY FED.

	Dry matter	Protein	Fat	Nitrogen free extract	Fibre
Lucern	955.40	192.19	30.04	496.58	205.46
Red clover,	974.95	141.03	29.38	587.42	209.36
Timothy.	920.21	48.67	16.15	528.44	306.88

We spoke of the stalks growing coarse and woody. Right here comes in the importance of sowing from 25 to 30 pounds of seed to the acre. Alfalfa should be grown thickly in order to overcome the habit of making coarse stalks. The extra cost of ten or fifteen pounds of seed is small indeed in comparison with the extra value of the hay that results from it.

DON'T PUT OFF

Seeing your friends and having them oin in for a good club of subscribers.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A New York Ration.

Please give me a balanced ration from the following feeds: Corn silage somewhat green, clover and timothy hay, wheat bran, $22; oil meal, $31; cotton seed meal, $31. Cows are grade Jerseys and fresh from 3 to 4 months. Is there any danger in feeding cotton seed meal, and if so, what is it? Will it cause abortion? J. H. J.

Linwood, N. Y.

Grade Jerseys that have been milking only three to four months, should be carried forward to pasture very liberally so as to prevent abnormal shrinkage. To this end, we recommend this inquirer to use a ration substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.53	.48	3 96	.16
5 lbs. bran	4.41	.63	1.93	.15
2 lbs. oil meal	1.82	.59	.65	.14
Totals	22.68	2.09	10.74	.66

If the cows will eat more of the silage or hay, let them have it up to the limit of their respective appetites, but not more than they will eat without waste.

We do not consider that there is any particular danger in feeding cotton seed meal in limited quantities, but there is a very universal opinion that it is better not to feed this meal during the later months of gestation, lest it might have a tendency to produce abortion. We are not as much afraid of this as a good many are, because it has been demonstrated in innumerable instances that cows fed cotton seed meal up to the time of freshening, have had no trouble. However, in deference to this almost universal sentiment, we hesitate to advise the use of cotton seed meal after five or six months of gestation. We have, therefore, specified oil meal in the above formula partly for this reason and partly for the further reason that this feed seems to have a dietetic value that the chemist cannot reach in his analysis nor the veterinarian fully explain. The fact remains, however, that, in some way and somehow, it serves a very excellent purpose.

Milk and Cream Yield.

I have a herd of Guernseys testing about 5.20. I propose to put in a separator and sell my cream. How much cream testing 22 per cent will my milk yield? For me it works out this way: 22:5.2 :: 100 lbs. : 23.6 lbs. cream. Allowing 2 lbs. to a quart of cream, would give 11.8 quarts cream from 100 lbs. milk. Is this right in theory? Does it work out that way in practice? W. W. H.

New Hope, Pa.

There will be a loss of 0.1 per cent of fat on the average in separating and handling the milk. This will make 5.1 pounds of butter fat available for cream? The yield under above conditions would be 23.2 lbs. of 22 per cent cream. A quart of 22 per cent cream will weigh 2.11 lbs. and the above amount of cream will make 10.9 quarts.

Alfalfa and Quack Grass

I have a field of rolling sandy loam. It has been cropped with beans two years with a good crop of rye plowed under last spring.

Owing to poor cultivation, there is considerable quack grass. Will this spoil the chance of getting a catch of alalfa. How can I tell if the soil needs lime? L. E. K.

N. Y.

Unless you are in a limestone country, it is more than probable that lime in some form will be necessary (wood ashes, marl, or unslacked lime). Manure the land well and give it good cultivation before sowing and the quack grass will not injure the alfalfa.

A Skim Milk Question.

At a certain factory in New York, equipped for making both butter and cheese, it is proposed to make partly-skim cheese this summer. The plan is to run a given percentage of milk through the separator and add the skim milk to the reserved whole milk. It transpires that some of the patrons of this factory, being better advised as to the feeding value of skim milk, have proposed to buy some of it, and the question submitted is: What can they afford to pay, and what can the factory or the other patrons afford to take for this skim milk?

Assuming that the mixed milk at this factory contains, as is most probable, from 8 to 9 per cent of solids not fat, of which not to exceed 3-7 is casein, the only element in skim milk that contributes to cheese making, 100 lbs. of the skim milk would make from 5 to 6 lbs. of full-skim cheese, worth in the New York market anywhere from 2 to 6 cents per pound. Deduct the cost of making and marketing, and there remains the value of this skim milk for cheese.

What can the farmer afford to pay for this skim milk? As above stated, in 100 lbs. there will be from 8 to 9 lbs. of solid dry matter, not less than 95 per cent of it digestible and worth at a moderate estimate, as other feed stuffs are selling from 2 to 2½ cents per pound.

Assuming the foregoing estimates to be approximately correct, the farmers can afford to pay 20 cents per hundred pounds for the skim milk, and this is quite as much as it is worth for cheese making purposes.

Cream Chart.

Do you have cream charts, and if not, where can we obtain them? There is a good number of hand separators coming into use here, and there is quite a demand for some means of ascertaining the quantity of butter contained in the cream. The most of us use Babcock testers, but heretofore have sent our milk to skimming stations.

Ellensburg, Wash. B. P.

The only one we know of is published on page 245 of Farrington's and Woll's Milk Testing, which can be obtained from this office for $1.00 post paid.

A Connecticut Ration.

Will you kindly give me a balanced ration to feed our Jersey cows, most of them have been milking all winter, and I have fed cotton seed meal and corn cob meal with ensilage and mangels with some corn stalks cut up. But now all our cob meal is gone, and we have only a few mangels left. Have ensilage and corn fodder enough to carry us through. Grain costs us as follows: cotton seed, $29; white flour middlings, $27; hominy, $20; ordinary middlings, $24; bran $23; corn meal, $24. What is the best way to feed corn fodder after it is cut up, dry or steamed? Do you advise putting grain on it before it is steamed, or after it is fed to the cows?

We make a specialty of butter, therefore have not fed any gluten. J. A. D.

Wallingford, Conn.

Unless these cows have been accustomed to heavy feed all winter, there would seem to be no sufficient reason why a ration substantially as follows, should not enable them to do about as well as could be expected:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.88	.39	4.20	.21
15 lbs. corn stover	8 93	.26	4.36	.11
2 lbs. cotton seed meal	1.84	.74	.36	.17
4 lbs. bran	3.52	.50	1.54	.12
Totals	22 17	1.89	10.44	.61

If for any reason it should seem to be expedient to add to this ration, we suggest that ground corn or corn meal be used and it can hardly be necessary to use more than two pounds. We would feed the concentrates, or grain part of the ration, in connection with the silage in order to secure its greater dilution, and add at least one teaspoonful of salt at each feeding.

Unless the corn stover is in such supply as not to make it expedient to feed it economically, we should never attempt to feed it dry, but instead of steaming it, we would cut enough to last a week, more or less. Dampen it somewhat and let it lie in a pile, where it will of its own accord heat up and soften and become, as it were, second or third rate silage. Steaming would operate in much the same way, but unless one has an abundance of steam for other purposes, we do not think it would pay to make steam especially for steaming fodder.

The objection to mixing grain with cut forage before steaming is that you have no opportunity to discriminate in feeding and it always is at least expedient to discriminate in feeding.

In regard to the postscript to the last inquiry, we feel it proper to say that we do not think there is any well founded objection to the use of gluten feed or gluten meal even where butter is the market product. It is probably true that these glutens tend to make a less firm butter than some other feeds but this would be, in our judgment, abundantly counteracted by the cotton seed meal.

Mixing Whitewash.

Will you please tell me the best way to mix whitewash to use with a spraying machine, and the name of the best spraying machine for whitewash on the market? A. H. B.
Roodhouse, Ill.

Ordinary whitewash is made by slaking lime in water. Put the lime in a pail or half barrel and pour on enough water so it will remain liquid and not dry out when the mixture slacks. Let the mixture stand until next day and when wanted, thin down with water so that it will spread easy with a brush. To prevent rubbing off when dry add an ounce of glue to a pail of whitewash. For use with a pump, the whitewash must be strained through a fine seive or cheese cloth as it would otherwise choke the pump and nozzel. For pumps and nozzels to use in whitewashing, write to Deming & Co., Salem, Ohio and see adv. on page 257.

The so-called "government" whitewash—the kind used at military posts, public buildings, etc., is said to be made and used in the following manner:

Slack half a bushel of good stone lime in boiling water, keeping it covered while slacking; strain and add half a peck of salt dissolved in warm water, three pounds of ground rice boiled to a thin paste, half a pound of powdered Spanish whiting, one pound of clear glue dissolved in warm water. Mix all together and stand for several days. Keep in a kettle and apply as hot as possible with a clean brush. Of course where such a large quantity is not needed, the mixture is to be reduced in proportion.

Alfalfa and Hard Pan.

Do you think alfalfa can be raised on clay soil where the subsoil is very hard? The surface drainage is good; no water standing on the top.
Oswego, N. Y. W. A. B.

If the subsoil is of the nature of a hard pan that can only be broken by blasting, the alfalfa roots cannot penetrate it and the plant will not do well. Between this and a soft subsoil are all stages, most of which the alfalfa roots can penetrate. Whether the roots can get through the hard pan above mentioned can only be told by trial. In any case it is best to start with alfalfa on a small scale the first year; an acre or two is sufficient.

Bloody Milk—Alfalfa.

I would like to ask you some questions concerning the raising of alfalfa. Part of our farm is situated along the creek, from eight to ten feet above the water line. It is composed of rather coarse gravel, but in most places is well covered with fine soil. Another part is five or six feet higher than the "flats," but has a subsoil of clay or hard pan. The remainder of the farm is side hill land, the soil being well mixed with red shale. Good crops of clover have been raised on all parts of the farm. Which do you think would be the best for alfalfa?

Have a three-year old heifer which dropped her first calf last May. During the fall she began giving bloody milk from one quarter of her udder. About every two weeks the milk would be affected for two or three milkings and then be all right again. P. R. S.
Windham, N. Y.

Land that will grow clover will grow alfalfa, but it should not be sown on land that is subject to overflow, or where the subsoil contains standing water. In the above case it will probably not do well on the coarse gravel unless there is a thick layer of good soil above the gravel, nor where the water is but a few feet below the surface, but it should be successful elsewhere on the red shale land. Where alfalfa is a new crop it is always well to begin on a small scale, an acre or two the first year, and increase the area as results warrant.

The cause of a cow giving bloody milk can, almost in every case, be traced to an injury of some kind to the udder. Uncomfortable stalls in which the cow is compelled to lie in such a manner as to squeeze the udder, are very often the cause. Your remedy is in ascertaining the cause and removing it.

Barley for Cows.

Is barley a good feed for milch cows? Also what is the feeding value of pigeon grass seed? If barley is good for milk, give us a balanced ration of barley, oats, corn and bran. J. R. W.
Elgin, Minn.

Barley is an excellent feed for milch cows, not only for stimulating milk production but for giving excellent flavor to milk products. It is, however, impossible to submit a formula, as requested, without information as to the kind and quality of roughage available. It makes a very material difference in the matter of selecting proper concentrates whether roughage consists of clover hay or timothy hay or corn stover and silage. Barley and bran would make a very good combination, so would oats and corn, but it would hardly be expedient or necessary to combine them all in one mixture.

Pigeon grass seed is similar to millet seed, but neither should be fed unground

Result from Feeds Not Satisfactory.

I am feeding cows 5 lbs. wheat bran, 2 lbs. cotton seed meal, 20 lbs cut corn stover, 10 lbs. timothy hay each, and the yield of milk is not satisfactory. I was feeding some gluten feed up to about a month ago, but gluten went so high I cut it out. Cows did well for a few days about two weeks and since then have been shrinking. Gluten feed, $28 a ton; cotton seed meal, $29; wheat bran, $23.

Please inform me if I can make any improvement in the mixture I am feeding and also please compound me a balanced ration of what I am feeding with gluten feed added. I also have some rye on hand which is very cheap. W.
West Webster, N. Y.

The ration as now fed, if the ingredients are of average quality, set out in tabular form, shows the following figures:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. corn stover	11.90	.34	6.48	.14
10 lbs. timothy hay	8.68	.28	4.34	.14
5 lbs. bran	4.41	.63	1.93	.15
2 lbs. cotton seed meal	1.84	.74	.34	.17
Total	26.83	1 99	13.09	.60

There is nothing in these figures to indicate that results should not be satisfactory, unless it is too large a proportion of roughage, especially if the cows are not above 1,200 lbs. in weight. Taking out 3 lbs. timothy hay and adding 1 lb. bran would be likely to improve the combination. A more important matter, perhaps, would be a careful examination of the bran and cotton seed meal to ascertain if both are free from adulteration and decay or damage of any kind.

To add gluten feed take out one pound each of cotton seed meal and bran and add 2 lbs. of gluten. And give the cows salt, a large teaspoonful with their feed night and morning. Boiled rye could be used in place of half of the bran.

A Balanced Ration, but Might be Improved.

Would you consider the following a balanced feed for cows:

Equal parts of gluten and cotton seed, two parts of bran, mixed. Seven pounds of the mixture fed once a day, with 12 pounds good hay and 30 pounds ensilage. Prices of the ingredients here as follows:

Gluten, $25.75 per ton; cotton seed, $27; bran, $20.50; hay, $18; ensilage, $5.

What changes, if any, would you suggest be made to obtain the best results for butter-making? F. E. H.
Fisher's Island, N. Y.

So far as mere digestible nutritive elements are concerned the ration above described, if the different feed-stuffs are of average quality, would contain 2.23 lbs. protein, 11.94 lbs. carbyhodrates and .68

"ADVERTISEMENT."

Dr. Shoop's Rheumatic Cure

Costs Nothing If It Fails.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever. I have done it fully 100,000 times.

I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.

Address Dr. Shoop, Box 934, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists·

A GREAT COMBINATION!

GOOD COWS AND A U.S. SEPARATOR FILL THE FARMER'S POCKETS WITH MONEY!

lbs. fat, or ether extract, sufficient, one might suppose, to enable any herd of cows to do their best. It is a question, however, whether the proportion of roughage to concentrates is not larger than is profitable, especially if the cows are not considerably above medium size. Moreover, for highest quality of butter, unless needed to give firmness to the product, it might be expedient to reduce the amount of cotton seed meal, if not to displace it altogether and substitute ground corn in its place. Take for illustration the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs hay	3.68	.28	4.34	.14
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. gluten feed	1.80	.47	1.01	.05
2 lbs. ground corn	1.78	.16	1.33	.09
Totals	23.70	1.80	12.42	.61

Assuming the hay to be timothy, this ration contains only 1.8 lbs. digestible protein, which is considerably less than was considered necessary a few years ago. It seems to be proven, however, by many carefully conducted feeding trials, carried on for several months, and in some cases for successive years, that this amount of protein is more than ample as an average for a herd.

A remaining consideration is the matter of cost. The feed-stuffs named are very high in price and it might pay to try the market for something equally as good but costing less.

Ensilage Freezing.

Will ensilage freeze? If so will that spoil it? I want to partly fill my silo as soon as I can get clover and sowed corn to feed at once. If I should not get the ensilage all fed out, can I fill in on top without spoiling? J. M. H.
Allen, Pa.

Of course, silage will freeze if given any opportunity, but freezing does not materially injure it, provided, it is not put before the cows in a frozen condition. In an ordinary silo, there is but very little freezing and that just about the sides, and sometimes the silage will cling to the sides for days at a time. Much of it can be pried off and all of it will fall sooner or later, and if the frozen silage is taken to the center of the silo, the heat from the balance of the silage will take the frost out and no serious damage will result.

It is within the limits of experience that silage has been kept in the bottom of silos for four or five years, the silo in the meantime having been filled and refilled repeatedly, and, when reached, the old silage is as good as it ever was. In putting new material above that which has been in the silo, care should be taken to remove all that is damaged to any extent.

Combined Corn and Cow Pea Planters.

Our good friend, W. H. Bruns, of Missouri, is still anxious to obtain a workable combined corn and cow pea planter. It would seem to us that the manufacturers might easily apply attachments to the ordinary corn planter that would solve this problem, but until they do so, there is probably no better way than to pursue the course followed by our Tennessee correspondent who uses a common corn planter with the cow peas in one receptacle and corn in the other and by going over the rows twice, succeeds in planting both at the same time. That is to say, in going across the field the first time, one row of corn and the other of peas is planted. In turning about, the receptacle containing the peas follows in the track where the corn was planted and this operation is repeated until the whole field is planted.

Co-operative Milk Depots in Cities.

The dairymen of this city wish to co-operate and put in a milk depot, and all take their milk to the depot and have it bottled and sent out at one place, and if there is any surplus milk left let it be made into butter. Is there anything like this being done at the present time, and is it a success?
Pasadena, Cal. A. McD.

Co-operative milk depots for cities are becoming reasonably common in recent years. These are sometimes located in the city itself, or frequently, in the case of large cities, perhaps 100 miles or more distant, and this is practically the only insurance the milk producers can have against frequent losses by overstocking the market. It goes without saying, that there must be some business capacity and business sagacity in the management of these depots, just as there must be business sagacity and capacity in the successful management of any other business.

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

Nova Scotia Queries—Capacity of Hay Loft—Vent'lation.

Will the DAIRYMAN be kind enough to give me some information through its columns upon the following subjects,

How many tons of well cured timothy or mixed hay right from the field, can be stored in a barn loft the size of which is 34x24 feet inside and 7 feet from floor to plate with an ordinary pitched roof over; the hay will be pitched in from outside.

In using the King method of stable ventilation, how large an out-take flue will be required to carry off the bad air from five cows in a stable 34x17 feet and 8 feet ceiling and also size of intake flue? Will one of each be sufficient? Want to have the air and temperature just right. Stable is a semi basement and unavoidably on the north side, but will be made very warm and light; windows north and east. READER.
Nova Scotia.

It would be but a wild guess to attempt to estimate the capacity of a hay loft of the dimensions given, as so much would depend, first, upon the character of the hay, as to whether it was coarse or fine, and second, as to the manner in which it was stored away. We think it doubtful if more than five tons could be put away in such a loft at a single filling unless it was pretty thoroughly tramped down as the filling progresses.

Prof. King's formula for ventilating shafts is four square feet of cross section for twenty cows. This presupposes a fairly good draft and a flue without any artificial aid.

The flue should be practically air tight through out its entire length, the same as a chimney. In order to secure good draft, it must not have openings. It would follow from this rule that a ventilating shaft or tube a foot square would be ample for five cows. It is altogether probable that it would be practically impossible to make a stable so impervious to air that enough would not come in in various ways to supply all the fresh air needed by this number of animals; but if this should be doubtful, provide one or two small intake flues with an outer opening three or more feet below the ceiling of the stable and the inner opening just below the ceiling. Intake flues are constructed in this way, rather than having direct opening through the wall, in order to prevent the escape of the warm air.

MEAL TIME DRINKS.

Should Be Selected to Suit the Health As Well As the Taste.

When the coffee toper, ill from coffee drinking, finally leaves off coffee the battle is only half won. Most people require some hot drink at meal time and they also need the rebuilding agent to build up what coffee has destroyed. Postum is the rebuilder, the other half of the battle.

Some people stop coffee and drink hot water, but find this a thin, unpalatable diet, with no rebuilding properties. It is much easier to break away from coffee by serving strong, hot, well boiled Postum in its place. A prominent wholesale grocer of Faribault, Minn., says: "For a long time I was nervous and could not digest my food. I went to a doctor who prescribed a tonic and told me to leave off coffee and drink hot water.

"I did so for a time and got some relief but did not get entirely well so I lost patience and said: 'Oh well, coffee isn't the cause of my troubles' and went back to drinking it. I became worse than ever. Then Postum was prescribed. It was not made right at first and for two mornings I could hardly drink it.

"Then I had it boiled full fifteen minutes and used good cream and I had a most charming beverage.

"I fairly got fat on the food drink and my friends asked me what had happened I was so well. I was set right and cured when Postum was made right.

"I know other men here who use Postum, among others the cashier of the Security Bank and a well known clergyman.

"My firm sells a lot of Postum and I am certainly at your service for Postum cured me of stomach trouble." Name given by Postum Co., Battle Creek, Mich.

The Cow Man

is pretty sure to be interested in the matter of milk cans. If you happen to be such a man we are favoring you by calling attention to our line of

STURGES Standard Approved Milk Cans

It is the best made line of milk cans in the world. Cans that are hedged against crushing and denting, seams soldered and tinned and retinned to shut out all chance of rust and secure perfect cleansing, and with perfect handles for convenience and security. The patterns include the famous **Iowa, Elgin, Chicago, Burn, Omaha, Wisconsin,** and other makes. Our Special Milk Can Catalogue will interest you if you want to buy the best.

We also manufacture and sell the now celebrated Dairy Queen Churn, the Boyd Cream Ripener, Success Skim Milk Weigher and a general line of Creamery and Dairy Machinery and Supplies, as well as building complete Butter and Cheese Factories equipped with the latest appliances. We handle only high grade goods and on the lowest possible margins of profit. We have separate catalogs covering the several branches of the Creamery and Dairy Supply business. Write us for anything you need and we'll mail you catalog.

STURGIS & BURN MFG. COMPANY,
Kansas City, Mo. Chicago, Ills. St. Paul, Minn.

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. **Remember,** the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round Handle.** As there are many inferior imitations of this can, we stamp all ours with the **Milk Can Trade Mark.** Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

GENUINE IOWA CAN

Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

R. R. ROGERS, Detroit, Mich.

I am not associated with any person, firm or company.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Silo—Hilee, Hilo!

Schwertfeger Talks and Also Builds a Silo.

DEAR GUFFERNOR:—Dat's wat's de de song of efery Cherman Dutchman wat's got a silo. Poody gwick dat'll be de song wat will be blayed de most on dem machines wat dey haf on de back barr of de saloons, You'll see. Chust so gwick as more of dem Dutchmens find out wat a goot ting such a silo shebang iss, dey all goin to haf one.

May be you tink dem Chermans was poody shlow; well, may be so; aber dey was shure. Wen dey got a goot ting, my, how dey can hang on! Und dey aint goin to let go till dey find someting a lots bedder. You tink may be it was takin dem a awful long time to find out apout de benefitz of a silo; well, may be so again; aber dare iss goot reasons for dat. Wat fore you always dalk your lectures in Engelish? Wat fore you don't shpeak to dem in languages wat dey can undershtand? Wat fore you always brint your baper mit Engelish? Wy you don't write Cherman, wat iss more confincing, heh? I betch you anyting you want to bet, dat your lectures und your baper was reshponsible for one-half of de Yankee silos in de country und some odder too. Do you call dat a fair shake for *us* fellows? Nossir—ee, I don't; und nopody else wat's got some sense don't neidher.

You see dem Chermans was prought up und edchucated mit a different language und dey cant shpeak und read und write such fine Engelish as I, so as to been able to undershtand all your highfalutin words und stuff; und den we'se allways a little fraid of dem darn Yankee dricks; aber you oncet show us how it is in Cherman, und we catch on chust so gwick as anypody und a goot deal harder. Oder may be you tink we dont know so much as dem Yankee fellows? Dare's ware you gets fooled on yourself; chust look at me! Und deys all like me dat way, only some knows more.

Nossir, I dont care not wat exshcuse you try to makes, *you* was reshponsible dat dare iss more Yankee silos dan Cherman ones. Und if you dont like dat shtatement you can sue me. It's apout time somepody tole you de trudh.

Now *I'm* going to write to dem apout de benefitz of a silo, und I was shure dey will beliefe *me*—dey got to, because dey know no Cherman efer shpeaks a lie wen he can help it.

Aber fursht I must ashk your adwice. You remember dat cow wat I wrote you apout de ferry fursht time? Well, I guess she remembers you, because you called her a "Cherman" cow. Dat cow iss goin to play de same drick on me again as last year. De shtork wisited her on August fifdeendh und apout a week later she gif forty-four bounds of milk a day. November dwenty fursht she gafe dwenty-four bounds, und today when she was in milk 249 days, she was shtill milking dwenty-dwo bounds. Poody gwick she gits a fine bashture, und dare you got it again! How in blazes can I try her up! I could'nt do it last year, und de fellows wat had her before me couldn't, und she's had tree oder four calfs already. Yo see dat nefer worrid me before, because I tought it showed she was a goot cow; aber a fellow wrote in a baper de odder day dat it will shpoil a cow unless she is tried up efery year. How iss dat? Iss dat so? Und wat can I do apout it wen I can't try her up? She's as shlick und frisky as a shpring chicken, und she eats anyting you gif her—rodden abbles und tings wat de odder cows sthick up deir noses at she takes to, like my Peter does to lemonade bie; wy she eats like a hogg—yes, worser.

Oh, I must tell you someting: May be you was right after all wen you called her a Cherman cow. You see, de odder day my wife she shtarted mit de last char of souerkrout; it was fine too, und we had some for dinner mit dumplins und shpare ribbs und a nice grafy—we haf dat every Tursday; aber you know on de top, wen you fursht shtart a new char, dare is always some wat is shpoilt und shmells pad. Well my wife she took dat off in a pan und said she would gif it to de hoggs. I said you bedcer try dem fursht, may be dey wont eat it; und I went along mit her. Well, shure enuff! She trowed in a big handful und dey all come und shmell of it: Aber dey chust took one shniff und shtuck up deir noses und grunted kinder mad, oder for someting else, I don't know wich, may be it was bodh. Well, den I said trow it on de manure pile in de parnyard. Aber my wife said, "Nossir, I'm goin to try de cows on it fursht;" you see she tinks so much of souerkrout, she don't like to see none wasted. Aber dem cows was as bad as de hoggs until she come mit de pan to Brownie. My grashus, dat cow she difed into it as dough it was punkin puddin, und eat it all up. Gosh, I was surprished; und you see she likes souerkrout chust like me, und may be she was a Cherman cow after all. My, I tink lots off her now.

Well, now let's see, wat was I'goin to write apout again—you always git me off my subcheckt! Oh, yes, apout silos. Well how shall I tackle dem fellows wat don't beliefe in silos, oder dont know nodding apout dem, so as to confince dem of de errors of deir ways.

Allright, I will fursht shtart in mit a exshplanation of wat a silo iss, und you fellows wat don't got none you follow mit me. A silo is a ting wat to put fresh food into to keep it fresh. It is chenerally put in wen we got blenty, more as we need, und taken out und fed wen we aint got none. Dat's it exactly. The refricherater und cold shtorage mens dey do de same ting. Dey buys eggs und butter und lots of odder shtuff wen dare iss blenty und wen dey can git it cheap und put it in deir kind of silo, und take it out wen dare aint none, oder anyway wen its more shcarcer und costs more.

The silo gifs us de same as green food in de winter wen dare aint none out doors; it iss in nice, short shape, easy to git at und easy to handle; de caddle und horses und hoggs und chickens all like it like crazy; dey keep shlicker und healtier; de cows gif more milk; und you can git a bigger amount off de richest feed from efery acre, can harfest it gwicker, more easier und cheaper, und can shtore it more handier and in less shpace dan anyting wat you got. Yessir, dat's wat I said!

Now don't you been in a hurry mit saying dat aint so, because I rebeat it, *it is so;* und I'm going do brove it on you. Furst let me dell you wat kind of shaped ting a silo iss. Well, its all kinds, dat's wat iss. Some iss round, some iss shquare, some oxagon, und some is wider one way dan the odder; but deys all eidher deep oder high. I like it bodh ways some. But de shape und dat makes no differentz. It's according to de blace you got to put it ware its most handiest, oder may be its only according to your notion. Maybe you was a shquare man, und darefore want it shquare und mit the corners poody well off; perhaps you was an all round man like me, den you want it round—(dis is only a choke). Anyway de shape makes no differentz a tall, except dat, like mit a man, it's bedder if de sharp corners has been taken off, because in the corners iss ware deys likely to be sometings shpoiled.

Well, I'll tell you fursht how I built mine; dat's de way us farmers always do. I wanted only a liddle one so I could haf it in de corner of my hay parn und so I don't need to build no exshtra roof on it. So I took me a shtake for de tzentrum und shlipped a shtring mit a loop over it; from de shtake I made de shtring chust half de diameeter long und tied a charp shtick on de end to shcratch mit; den I walked around und shcratched a round tzircle all around. Den I had it digged out six foot deep und walled up mit shtone und tzemented. On de top I set a sixteen foot high shtave barrel as big around as de hole in de ground. Dat was made of matched six by dwo inch blanks und held togedder mit shtrong iron hoops.

Before de shtaves was put togedder I had dem bainted inside und outside und in de groofes und tounges mit dwo coats aferishus carbolinum. Dat's all dere was to it. I didn't efen fasten de barrel part onto de wall because I toughd it wouldn't git away anyway, und it didn't. Dat's wat we calls a silo und its about so cheap a one as can built. But I got some frients wats got goot deal better ones und wat cost more money; some are round und some shquare und some oxagon; some are shtave, some frame und some of wood und blaster und some of brick und so weiter. Makes no differentz how you build so long as you makes it as deep in de ground as your location allows und as high, too, und make it air tight eferywhere, except on top. So much as you git in de ground iss dead shure tight und will lasht anyway forefer, und costs chenerally only your own labors und de lime und shtone mason; darefore put all you mit confenience can below de ground. Aber iff you can't, put it on top off de ground—put it somewares anyway. Furst ting of all, iff you get de noshion its a goot ting finally a liddle shtarted in your head, go by some one wat can figger it out for you wat it costs. I'll betch your poots it'll be a good deal less dan you was shcared apout.

Den look around a liddle so as to make shure wat kind iss best for you, ware it'll be most confenientest, wat size you want, etc. Den go ahead und build it to oncet und let no one shcare you out of it.

De odder day I heerd a fellow say he knows of some farmers wat apandoned dier silos. Dat's so, may be; und I know of some fellows dat keeps cows wat don't give enuff milk to pay for deir feed, und who'd do bedder to sell de feed und safe de labor of caring for und milking de cows; und I know of fellows de creamery mens had lots of trubbel mit to git dem shtarted do keep cows a tall, wen dairyin was first dishcovered, and byme by dey did und made more money dan efer before; und also I know fellows wat dont like souerkrout und don't drink beer! Aber dat dont brove not a tall dat bodh aint goot; aint I right?

Now look here, Mr. Gufferner, dis artickel's goin to been too long for your baper, I mean if you put it in all to oncet; so I guess I do like wen dey write a goot shtory, make it "to been continued in our nexsht." Wat you tink? All right; aber in de nexsht baper I show dem fellows sometings apout silos wat will make dem laugh! Your frient,

AUGUST FRIEDERICH WILHELM SCHWERTFEGER.

CONCERNING OUR ADVERTISERS.

D. S. Stewart, Antigo, Wis., is offering, in an advertisement this issue, some good bargains in 160-acre farms. These lands are situated in Northern Wisconsin where is found some of as fine land, agriculturally, as will ever be found. Don't pass these by if interested, but get such information as you want about them by writing the advertiser.

A WORD ABOUT A WINDMILL.

There is a chain of Samson windmills all around the world. In every civilized country on the globe, Samson windmills are in use, and in nearly every country there are located agencies for the sale of these wind engines. In no country of the world are so many Samsons in use as in our own, where the very best of everything is appreciated and demanded. The reason for the universal popularity of this celebrated windmill is attributable to its strength, ease of running, efficiency, and long life. It is the only windmill made on scientific principles, using a double gear in place of the one-sided single gear affairs that have worn themselves out and worn out the patience of their owners in times past. The Samson is the windmill of the present and of the future, a revolution and a revelation in the possibilities of wind propelled machines. It is simple, strong, superior, and needs but to be seen in comparison with others to have its points appreciated. There is a book published about the Samson windmill at a cost of several thousand dollars, a copy of which will be sent to any of our readers who will take the trouble to send a postal card to the Stover Mfg. Co., Dept. P., Freeport, Ill. and request that it be sent them. It is well worth reading.

A separator cleaner has been placed on the market by M. H. Fairchild & Bro., of 199 Michigan St., Chicago, Ill. There is unquestionably a great deal of merit in this "Sepo Cleaner" as it is called, and we do not doubt the least but that hundreds of the readers of the DAIRYMAN will at once avail themselves of the opportunity and write for circulars investigating its merit. There is no article on the market that has been more satisfactory in the creamery trade as a cleanser of separators, vats and all apparatus and tinware like the preparation made by this firm. They have put up this "Sepo Cleaner" in small packages and a trial by any dairyman will prove very profitable. Write them for circulars. This cleansing powder has been endorsed by the best authorities every where, and creamery men and dairymen who are using it are its highest praisers.

NEW BUGGY BOOK.

The newest thing in buggies and pleasure vehicles of every description are illustrated and described in full in the new 1903 Buggy Book of the Kalamazoo Carriage & Harness Mfg. Co., 148 Ransome St., Kalamazoo Mich., which it is promised us will be sent prepaid and free of all cost to such of our readers as send their name and address to that company. Here is a chance to become informed on the best new and latest improved staple vehicles without any expenditure of money. The Kalamazoo Carriage & Harness Mfg. Co. were the very first to enter the field with a thirty-day free

YORKSHIRES A few choice imported Boars. September farrow. Also pigs from imported stock ready for delivery in 8 weeks. W. H. FISHER, Spahr Bldg, Columbus, O

BERKSHIRES. We are breeding Imported boars on Gentry's great Duchess sows, weighing 600 pounds. Our herd is very select, every animal a gem. All our choice pigs of 1902 farrowing have been sold. We are now taking orders for 1903 farrowing.
JOHN WHITE & SON, Adamstown, Md

10 DAYS FREE TRIAL

We will send any bicycle to any address with the understanding and agreement that you can give it 10 DAYS' FREE TRIAL and if you do not find it easier running, handsomer, stronger, better finished and equipped, more up to date and higher grade than any bicycle you can buy elsewhere at $5.00 to $15.00 more money, you can return it to us at our expense and you will not be out one cent.

SEED CORN

Our Yellow Selected Seed Corn is unexcelled for strong, healthy growth and consequent big yield. Small cob and deep grain. In a word—strictly reliable seed. Shipped in twill bags of two bushels each. Price $1.25 per bushel f. o. b. cars here. Sacks 15 cents apiece. Prompt and careful attention to all orders.
E. A. CLENDENIN & BRO.,
Colora, Maryland.

A CHANCE TO MAKE MONEY

I have berries, grapes and peaches a year old, fresh as when picked. I used the California Cold Process. Do not heat or seal the fruit, just put it up cold, keeps perfectly fresh, and costs almost nothing; can put up a bushel in 10 minutes. Last year I sold directions to over 120 families in one week; anyone will pay a dollar for directions when they see the beautiful samples of fruit. As there are many people poor like myself, I consider it my duty to give my experience to such and feel confident anyone can make one or two hundred dollars round home in a few days. I will mail sample of fruit and full directions to any of your readers for nineteen (19) 2-cent stamps, which is only the actual cost of the samples, postage, etc. FRANCIS CASEY, St. Louis, Mo.

WISCONSIN FARMS

in Dunn, St. Croix, Barron, and Price counties make the best homes on earth; because, 1st. soil heavy; 2d., some timber, fuel cheap; 3d., springs and streams numerous; 4th, no blizzards or drouths; 5th., no sand or pine stumps; 6th, near the best northern markets; 7th, best dairy section known; 8th., no crop failures; 9th., successful settlement and all prosperous; 10th., corn, oats, wheat, rye, potatoes, tobacco, hay, etc., unexcelled in the United States

If you want a Canadian home, we can, and will take you to the best locality in Manitoba or Assiniboia. Send for catalogue or come yourself. D. S. STEWART, Antigo, Wis.

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

WASHINGTON, D. C., May 27, 1901.
The trial of your "Purifier" made at my request, interests me very much and strengthens my conviction that this "Purifier" is an article which, if it continues to produce the results attained the present season, is destined to be of great importance and value in many dairying districts of this country.
[SIGNED] HENRY E. ALVORD,
Chief of Dairy Division, U. S Department of Agriculture

The use of our "MRS. LEA'S MILK AND BUTTER PURIFIER" is a necessity to producers of milk and butter when the pastures are at all infested with Garlic, Onions, Rye or Clover. It is a great saving, as the cows can be grazed, thereby saving largely in feed expenses. It always removes the taints when properly fed. The best dairies are using it largely and with profit. Try it and you will find it to your interest. For sale by The Dairymen's Supply Co., Philadelphia, Pa.; Farmers' Exchange Co, Belle Mead, N. J.; Cook & Brady, Middleton, Del; Filston Farm, Baltimore, Md.; Gardiner Dairy, Baltimore, Md.

Manufactured by VIRGINIA CATTLE FOOD COMPANY, Danville, Va.
Write Us for Prices and Further Information.

trial offer to the people, allowing anybody to use the buggy he thought of buying for this length of time before definitely deciding whether its merits would warrant him in keeping it or not. Being large makers of buggies and harness, and having years of successful dealing with the user direct to refer to, it is their proud boast that their product has become known as the standard by which other makes are judged, "Kalamazoo quality" being recognized as the very highest, while the prices are astonishingly low, owing to the elimination of all jobbers, retailers, and middlemen generally, all transactions being direct between maker and you. The Buggy Book is yours for a word. Say that word now.

As to Eggs and Other Things.

Somebody has said that there is no such thing as a tolerably good egg About so, isn't it? It's another way of saying that work poorly done can never be satisfactory. Take the matter of tanks and silos, in which so many of our readers are interested. The A. T. Stearns Lumber Company of Boston, builds but one quality and that the best. It would be possible to reduce the selling price by using fewer and lighter hoops, inferior lumber and hasty workmanship; but the Stearns Company prefers to build right—to last. There's nothing "tolerably good" about a Stearns-made tank or a Stearns-made silo. They are simply the best that can be produced.

Quotes From the Scriptures.

Ward & Andrus, proprietors of the creamery, at Randolph, Wis., have the following quotation from scripture, (interposing the word in parenthesis) printed on their butter wrappers: "Butter and honey shall he eat, that he may know to refuse the evil (oleo) and choose the good.—*Isaiah 7:15.*."

Our Special Elgin Letter.

Ed. Hoard's Dairyman:—On the Elgin Board of Trade today butter slumped to 25c. New York market is the same. The output for the week was 508,900 pounds. Receipts, 5,209 tubs. Former prices were:

	Sales.	*Price.*
April 13, '03	0 tubs	27½c.
April 21, '02	10 "	27c.
April 22, '01	20 "	20c.
April 20 '00	0 "	18c.

Elgin, Ill., Apr. 20, 1903. H. C. B.

DAIRY MARKETS.

ELGIN, Ill., April 20—Butter—Slumped in price today to 25c on the Board of Trade, 2½c lower than last week. The fall is due to excellent spring pasturage and the increasing milk product. Sales for the week were 508,900 pounds.

SHEBOYGAN, Wis., April 15—Cheese—On the Call Board here today 823 boxes of cheese were offered and sold as follows: 29 boxes of Twins at 12⅝c; 10 cases Daisies at 12½c, 169 at 12⅝c, 251 at 12¾c; 116 cases Young Americas at 13c; 39 cases of Longhorns at 13c, 209 at 13⅛c. Market active.

ST. LOUIS, Apr. 20—Butter—Steady; creamery, 20@28c; dairy, 18@21c.

Eggs—higher; 14c for fresh.

KANSAS CITY, Apr. 20.—Eggs— steady; fresh Missouri and Kansas stock, 12½c. doz. cases returned; new No. 2 whitewood cases included, 13¼c. Butter—Creamery, 20@24; dairy, 19c.

NEW ORLEANS, La., April 20—Butter—Market irregular and declining rapidly. Free offerings at 25½c.

PHILADELPHIA, Pa., April 20—Butter—Steady; Solids 26c. Prints 27c.

TOPEKA, KAN., Apr. 17—Creamery butter, 26½ to 28c; dairy 17½ to 19c.

Cheese—Longhorns 13¾c; Twins 13¼c; Daisies, 13¾c.

LIVERPOOL, April 20—Butter—Finest United States nominal; good do, 78s.

Cheese—Steady American finest, white 69s; colored 69s.

CANTON, N. Y., April 18—Cheese—Offered 272 cheese, and 713 tubs of butter. Cheese 12½c offered, but no sales. Butter sold for 22¼c.

NEW YORK, April 20—Butter—Receipts, 5,219 packages; steady; state dairy, 17@24c; extra creamery, 25c; renovated 12@19c; creamery, common to choice, 18@24½c.

Cheese—Receipts, 1,933 packages; firm; state full cream, fancy, small colored, fall made, 15c; small white, fall made, 14¾c; large colored, fall made 14½@14¾c; large white fall made, 14¼@14½c,

Eggs—Recipts, 31,968 packages; strong; state and Pennsylvania, 15½c; western storage packed, 15@16c; Kentucky, 15@15½c, western firsts, 15½c; southern, 14½c..

NEW YORK MARKET.

NEW YORK, April 18th.—Butter—Receipts for the week, 31,430 packages. Exports for the week, 2,468 packages.

Full receipts of fresh creamery butter from this state and other eastern points caused a surplus of fair to good creamery, and easier and lower prices were accepted to make any considerable sales, but at the close there was more than could be sold and price for extra creamery dropped to 25c.

New York State dairy make comes sparingly and very irregular in quality, fancy tubs sold at 25c, and entire lots poor to good at 20 to 23c. June make creamery butter is about out of the market, and we drop quotations. Low grades butter continue plentiful and prices favor buyers. We quote:

Creamery, extra, 25c; medium, 23@24c; poor, 18@22c Dairy, extra, 23@25c; medium, 20@23c; poor, 15@18c.

Cheese—Receipts for the week, 11,883 boxes. Exports for the week, 3,843 boxes.

A little sprinkling of new cheese here this week sold at 13 to 13¼c, and showed good quality for the season. Old cheese are having a fair demand but at less price than quoted. Skims in full supply and under grades are neglected and prices nominal. We quote:

Full cream, old, extra, 14¼@14½c; medium, 13½@14c; poor, 10@12½c. full cream, new, extra, 13½@14c; medium, 12@13c; poor, 8@10c.

Eggs—Receipts for the week, 125,750 cases.

A good free trade is going on and receipts were quickly disposed of on arrival at full prices. We quote:

New York & Pennsylvania, finest marks, per doz. 15½@16c; Western & Storage packed, 15¾@16c; Northern & Western, regular pkgs, 14@15½c.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—in the Virden District, Manitoba, two adjoining 320 acre farms; soil, black prairie mold. No. 1 has 270 acres cultivated, bank barn 40x70 with geared windmill and waterworks in stable; 5000 bushel granary with elevator; large tool house, and 12 room dwelling, wind breaks, shade trees, 4 miles fencing; price $6,500. No. 2 has 280 acres cultivated, balance fenced pasture and hay; stable for 40 head; 5000 bushel granary, tool house, and 5 room dwelling; price $3,500. For terms and particulars address ROBERT TURNBELL, Two Creeks, Manitoba. 10-2

For Sale—Jersey bull 9 mos. old. Solid color, black tongue and switch. Sire, Romp's Victor Pogis, No. 38514. Dam, Miss I. F., No. 144547. Inquire of J. H. FRYER, Whitewater, Wis.

Wanted—Two single men on dairy. Only good milkers and farm hands need apply. Wages $27 00 per month. Commence at once. C. H. CROOK, Ottawa, Ill. 11-2

For Sale—Four young registered Guernsey cows, all fresh. J. E. STORY, Stanley, Wis. 11-tf

Wanted—Man who can furnish his own help to run 60-cow Jersey dairy (no farming). Contract one year. State experience. For details address J. D. ROSZELL, 223 So. Madison, Peoria, Ill. 10-2

Farm Manager, capable and experienced in dairy farm work is desirous of securing a position. 39 years old and have had 20 years experience in the work. Have successfully managed registered herds of dairy cattle and am familiar with modern dairy machinery and methods. Well educated. Address R. E. N., care Hoard's Dairyman. 8-4

For Sale—Complete city dairy (no cows) and ice cream plant in thriving southern city. Output 500 gallons milk daily at profit of 9 and 10 cents. Daily expense less than $30.00. Price $7,000. Can furnish experienced dairyman and ice cream maker with $2,000 cash to invest in the business as a partner, or will sell as a whole. Best reason for sulling. Address "APRIL", care of Hoard's Dairyman, Fort Atkinson, Wis. 8-tf

Berkshire Boars ready for service, for sale. Also spring pigs. Quality high, price low. GEO. V. SAFFARRANS, Palmyra, Mo. 11-2

Wanted—A situation as cheese maker, by the month or the hundred, or will rent a factory. 29 years experience. Good references. A. VANBRUNT, 204 Coleman St., Olean, N. Y.

ONLY REGULAR AWARD, CHICAGO, 1893—GRAND PRIZE, PARIS, 1900—ONLY GOLD MEDAL, BUFFALO, 1901

NOW IS THE TIME

TO BUY SEPARATORS.

If you are a creameryman with an old "hollow-bowl" separator of any kind NOW is the time to scrap it and put an "Alpha-De Laval" in its stead. . . .

If you are a creameryman and thinking of putting out hand machines among your patrons for cream gathering NOW is the time to do it. . . . .

If you are a farmer and thinking of putting in a cream separator for home use NOW is the time to do it.

Conditions were never as favorable to the use of the best, and the best only, of cream separators as at this time. . . . . .

248 McDermot Avenue, WINNIPEG.

For Sale—One Reid separator, capacity 2000 lbs. per hour, good as new. Also gang cheese presses, never been used, curd mill and vats. ALEXANDRIA CREAMERY CO., Alexandria, Pa. 9-3

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

Wanted—Situation by expert retail dairy manager. All branches of the business thoroughly understood. Have references second to none. Address J. O. G., care Hoard's Dairyman. 8-tf

The Business Herd of Holstein-Friesian cows are being closed out at a great sacrifice, and if you want one or more officially tested, good business cows write at once and secure first choice. State just what you want and save time and correspondence. F G. JOHNSTON & CO, Sta. B, Columbus, O. 11-tf

Wanted—A first-class manager with experience to take entire charge of my herd of one hundred cows. Write for particulars, stating experience, age and salary expected. BOX 529, San Antonio, Texas. 11-3

Holstein-Friesian Bulls from one to fourteen months old at prices that will surprise you. O. J. GODFREY, Pennellville, N. Y. 11-tf

Cheesemaker Wanted—Experienced, capable and industrious. Address, for particulars, P. E. CRANSTON, Sabin, Wis. 10-3

Wanted at Once—Man and wife to work on small dairy of 25 head. Must be good, clean milkers. Salary $35.00 per month. Free rent and fuel. Give experience, age and nationality. WM. J. HOFSOMMER, Breese, Ill.

Cheese Maker wanted at once. State wages expected. Address T. B. ROBERTS, Roberts P. O, Minn. 11-2

Wanted—Good man to represent leading jobbing house, salary or commission. Address RACINE MERCHANDISE CO., Racine, Wis.

Wanted—Position by cheese maker about May 1st. LOUIS SCHUASSE, Faribault, Minn.

Wanted—Farm hand from now until January 1. A good all around farm hand. No dairying. Every thing in good, first-class shape and nice farming. Give price and reference. Address BOX 51, Florida, Henry Co., Ohio.

Guernsey Bulls—Best blood, 2 Experiment Station tests. WM. BLACK, Mt. Vernon, Ind. 11-2

Barred Plymouth Rock eggs from a pen of choice hens and a fine Thompon cockerel. 15 fresh eggs for $1.00. J. BLACK, Bremen, Ohio.

Wanted—A good milker and dairy hand. Address ARTHUR EVANS, Vicksburg, Miss. 11-2

Position Wanted—Experienced creamery manager wishes position as manager or butter maker in up-to-date creamery. Makes all by-products of milk. Taken one course at Cornell Dairy School. A No. 1 references. B. E., care Hoard's Dairyman. 11-tf

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

For Sale—One fine registered yearling Guernsey bull. Address S. L. DIETZ, Hyde's P. O., Md. 8-4

For Sale—To settle estate, dairy farm and milk route, one and one-half miles from Mauston, county seat of Juneau County, Wis. 35 cows, 200 or 280 acres as desired, with fixtures and stock. Basement barn. There is good tobacco land on this farm. Enquire of B. N. SOUTHER, Mauston, Wis. Box 336. 9-5

For Sale—10 h. p. Leffel boiler with Moore steam pump, fine condition. A bargain. Address BOX 54, Hastings, Ill. 10-2

Half Rates to New Orleans, La.—Via the North Western Line. Excursion tickets will be sold at one fare for round trip May 1, 2, 3 and 4, limited for return by special extension until May 30, inclusive, on account of Annual Meeting American Medical Association. Apply to agents Chicago & North-Western R'y. 10-3

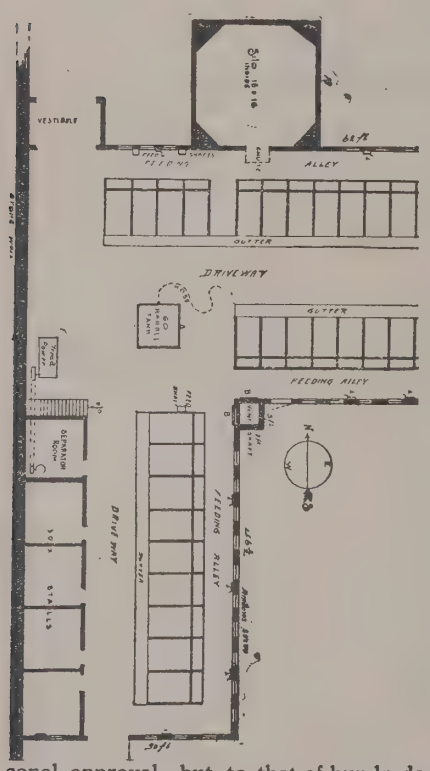
Very Low Rates to California and Return—Via the North-Western Line. First-class round-trip tickets on sale May 3d and 12th to 18th, to Los Angeles and San Francisco. Favorable limits and stop over privileges and choice of routes. The overland limited, most luxurious train in the world, leaves Chicago daily 8:00 p. m. Less than three days en route. Drawing room and compartment sleeping cars, observation cars, dining cars, buffet-library cars, (barber and bath) electric lighted throughout. Three trains a day from Chicago to the coast through without change. Daily and personally conducted tourist car excursions to California, Washington or Oregon. For particulars apply to ticket agents Chicago & North-Western R'y. 8-7

Very Low Rates to Dedication Ceremonies of Louisiana Purchase Exposition, St. Louis, Mo.—Via the North-Western Line. Excursion tickets will be sold for the above occasion April 29, 30 and May 1, and on account of Good Roads Convention on April 26 and 27, all with return limit until May 4, inclusive. Apply to agents Chicago & North-Western R'y. 9-4

To Colorado in 1903—The passenger department of the Chicago & North-Western Railway has issued a very interesting folder, giving information as to reduced rates and sleeping car service, with a short description of the various points of interest in Colorado usually visited by tourists, these excursion rates applying on account of the Christian Endeavor meeting to be held at Denver, July 9th to 13th. Send 2-cent stamp for copy, to W. B. KNISKERN, Passenger Traffic Manager, Chicago. 9-6

Homeseekers' Excursions to the Northwest, West and Southwest, and Colonist Low Rates West—Via the North-Western Line. Excursion tickets at greatly reduced rates are on sale to the territory indicated above. Standard and tourist sleeping cars, free reclining chair cars and "the best of everything." For full particulars apply to agents Chicago & North-Western R'y 5-8p

A Barn for Fifty Vermont Cows.



ED. HOARD'S DAIRYMAN:—Last November I had the misfortune to lose my barn by fire, together with 90 tons of hay and seven cows. I am planning to build another this spring. I wish to build large enough to accommodate 50 cows. Had thought that perhaps 44x90 would give me room enough, the first eight feet or basement for stable only, the next 20 feet for hay with a 12-foot drive, or barn floor, as it is sometimes called; barn to set east and west, with west end 20 feet from retaining wall, bridge from wall to barn. Stable to be on ground floor with no cellar under. Would like to have cows head out and have plenty of room for pens for calves, bull and hospital.

I cannot quite get a plan of stable to suit me. Can you or any of your readers of the DAIRYMAN help me out?

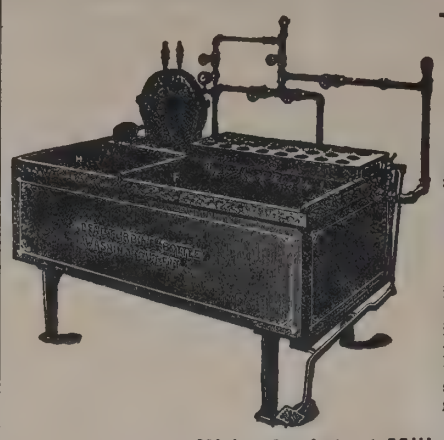
What is the cost of cement floors for stable, and what is the best system of ventilation for stable of that size?

Washington Co., Vt. SUBSCRIBER.

It is not good policy to crowd fifty cows into a barn 90′ long. It can be done, but at the expense of doing away with convenient passage ways. Neither would we build a barn more than 36′ wide, as such width will comfortably accommodate two rows of cows. Of course one can build wider and thereby obtain room for young stock and box stalls as indicated on page 260, in reply to T. K., of Montreal. Such a structure will cost less than to build after our favorite model, but the saving in cost is at the expense of greater ecomony and satisfaction in administration. This plan has been published several times, and has been tried by the Senior editor, not only to his personal approval, but to that of hundreds of visitors who have inspected it. The accompanying illustration shows the general plan of the stable, and not the least among its advantages is the facility with which it lends itself to indefinite expansion without disarrangement of the original plan, as either wing may be lengthened. In fact, since this cut was made, additions have been made in this way.

Note and Comment.

Some Ohio Weather.—Cows on March Grass.—Old Pastures.—Dairying vs. City Milk.—Summer Soiling Crops.—Summer Silos.—Agricultural Education.



ED. HOARD'S DAIRYMAN:—These few lines are being written the 24th of March, at the close of the most remarkable two weeks weather ever known in Ohio, soft, warm, balmy weather, with twelve nights in succession of frogs singing, fields a-greening and buds a-swelling and mud a----ing, for never was the mud deeper, more clinging and disposed to go to greater lengths, than on, and in this "bannana belt" of northern Ohio this now, present spring. The pastures have a most decided green look and soft under foot to correspond. A trolley trip of some [seventy miles, a day or two, since, through a dense dairy district, showed a surprising thing. A great majority of the dairies were being allowed to roam the fields in search of this greenness, and was getting a "heap of walk" out of the endeavor. Nearly all of these farmers are winter dairymen, making milk for the Cleveland market.

Was this March grassing of cows profit, or loss? Is it any wonder that it now takes full five acres of pasture and all the grain a man can buy, to summer a cow? Is there any connection between all sorts of foul weeds, rush grass and brush on these natural blue grass pastures and this spring tramping and poaching of the fields by the cows and stock generally? A peculiarity of these pastures is that they have never been plowed since cleared 100 years ago, and the blue grass came in as a native with his patent of nobility, and despite lack of care, all forms of abuse, never a pound of applied fertility. "Some of him," this king of grasses, is here yet, but this present March assault looks like an attempt without excuse to exterminate this friend of the dairy, and by violence "punch" it in out of sight. Little wonder that the dairy farms of this section sell at such ridiculously low figures, compared with the farm lands of other states and localities. Tenant farming! No, that does not explain it! Tenants are not sinners above all others in the land. Their methods are not greatly different from land owners. If the latter do not set the example, what can be expected of the other class? What's the use of preaching alfalfa culture to men who "grass" their cows in March?

We suggest to J. P. S., (page 124) that instead of having big doors to his stable, so large that he can drive in a team and sled and have doors that soon refuse to shut any where near tight, that he put in a single track manure carrier, make the stable more compact and "to order," and if he would put in two board shafts 12×14 inches inside dimensions, commencing at the floor and going straight up and to be at least 30 feet in height, not costing more than $12 for the two, he will have as pure air as needs be for his little dairy, and it is some comfort to a cow to have fresh, pure air to breathe all of the time, even if fed grandfather's way.

What about the dairy situation and future prices? If the scrabble for city milk is any "sign" to go by, it will be a long time until milk again reaches its low point of three years ago. Cheese factory after factory, and that in Ohio means a butter annex, has shut its doors and the milk is going to both Pittsburg and Cleveland by the train load. No. 1 creamery butter at wholesale in Cleveland was 30½ cents this morning and the price of milk is $1.40.

With all our prosperity, I am convinced that the dairy industry is actually slipping back in Ohio. This for two reasons: the high prices of feeds, and the scarcity of hired help, and its sky high prices, when it can be had. The industrials are

THERE ARE PROBABLY MANY GOOD THINGS
THAT YOU NEED and ought to have, but don't know it.

Here is one of them:

OUR Ideal Turbine Bottle Washing Outfit

We have condensed a whole lot of good things into this outfit. Just packed them up from all around your milk depot and compressed them into one convenient piece of apparatus. Here you have washer, rinser, sprayer, and washing tanks all within easy reach. This is only one of several specialties we have in this line. Our information in this line is yours for the asking.

"FEEDS and FEEDING" ....

A HANDBOOK FOR THE STUDENT AND STOCKMAN.

By W. A. HENRY, Dean, College of Agriculture, Madison, Wis.

This large octavo volume of 663 pages is the only book extant which summarizes all of the feeding investigations of all of the experiment stations of both the New and the Old world. It presents the latest discoveries of the scientist, and is replete with the practical experiences of the best stockmen. The information is arranged in the most helpful and readable manner possible.

PRICE $2.00 PER COPY POSTAGE PAID.

For Sale by HOARD'S DAIRYMAN.

sifting out the best of our help all of the time for their wants, and the eight and ten hour day, and high wages, leaves the farmer little option other than to stand by and see them go. Its no use to say that the dairy is growing as fast as the city demand, and that last is larger per capita each year. Practically we have no foreign demand that is as good as our own, and were it different, we have nothing to ship. I was in one of the few hold-on factories this morning, and there was less than 100 cheese on the shelves. Where are the rest? I asked. Gone to the market to fill orders, and these are all spoken for as soon as dry. I havn't another cheese in stock aside from these. A spring market bare of cheese is not a bad sign for a dairyman, and 4,000 new inhabitants pitching their tents daily in this country. Unless we have a financial head end collison, and the cheese eaters ditched, dairy produce must rule well as to price for many moons to come.

Some one, to whom the credit is lost, said "that twice the energy was required to keep out of Heaven, that was needed to secure a sure entrance." I am reminded this in looking over a file of exchanges recently and noticing the advice given as to the summer soiling of a dairy, the lists of what, when, and how to sow, to insure a series of crops to augment and piece out the summer pastures. There is an "if" more or less concealed, in the whole of the advice. "If the season is favorable, you will have an abundance for the stock." If it is not, you are left to do the best you can without advice. This is oldish advice but our suggestion is, why not build a silo for summer feeding and fill it with corn the fall before, and know that you are going to have a soiling crop.

The record is all in favor of this method. East and west its success is lauded by every one who has tried it.

Is it as much work to put a couple of acres or so of corn into a silo, and have an abundance of summer feed, as it is to put several acres of this and the other thing into plats and be tied to the crop all summer,— assuming that the season is good? Silage in our silo has kept splendidly for three years. It's no use to say it will not keep! We are convinced that this is to be the coming way of summer soiling of the dairy cow, because more certain, more economical, and concentrated.

One must know Willet M. Hayes of the Minnesota School of Agriculture to appreciate his wide open heart, genial well wish, and friendship that never is less. His best wish is for the boys and girls on the farm and that they may have the best education possible with which to meet the duties of life. Not long since he and I talked of the centralized school for the rural districts, and its great possibilities —wisely administered,—to make the farm supreme in claiming its rightful own. It was refreshing to hear him plan and prophecy for the farm education. In the last *Tribune Farmer*, of N. Y., Prof. Hayes goes a step beyond in rural education. He would have the township centralized school have its little farm of not less than ten acres, with the principal of the school residing upon it, in a nice cottage, and well versed in farm science, and the lady teacher to understand domestic science, and then in addition to the regular course, there should be a certain amount of farm teaching with practical demonstration on this little farm. It sounds too good to become true. The great public school in the city has been called "other peoples college." The boy and girl in the country has had to be content with a $500 school house without modern improvements and a plan of study that could not be tortured into being called a course in any thing, but must pass for an education, and suffice to fit one to engage in the most complex of industries and expect him to succeed. Somewhat like taking a boy who can barely name the notes on the staff, and expect him to play solos in Sousa's band in ten days. The Professor did not say, but no doubt when he gets his ideal school in operation, HOARD'S DAIRYMAN will be used as a serial text book, and here's hoping!. JOHN GOULD.

Ghio.

Concrete Silos—Good Results from Corn and Soy Bean Silage.

ED. HOARD'S DAIRYMAN:—A neighbor has been asking advice regarding silo erection. He has the best of gravel on his farm, and I have been suggesting that he investigate the matter of using cement to make his silo. Never having seen one so constructed and being informed that some are being erected with hoops, some without, I send this note to inquire what you judge would be best for him to do. If you care to give details in your answer, they will be welcome. My silo is a stave silo, and good now. You may be interested to learn that it was filled with corn and soy bean silage. We mixed a half bushel of the soy beans with the seed corn for about nine acres. The big drill sowed them with no trouble, the harvester cut the crop as readily as though no beans had been present. The bundles were a little heavier at the butts; this did not seem to inconvenience the men or the machinery. The cattle like the silage. Whatever the soy added, cost so little that it is most all gain.

If you send me a few sample copies, I will be pleased to hand them to dairymen. H. B. C.

Rochester, Mich.

We would rather undertake to superintend the erection of a half-dozen concrete silos than to write out directions for others to follow. This style of silo appears to be becoming quite popular in Canada, and there are builders there who make a specialty of erecting them. We have copied, from time to time, from the *Farmers Advocate* of Toronto instructions for building them, but in every case important particulars were omitted. We are told, also, that several concrete silo have been put up in eastern Michigan.

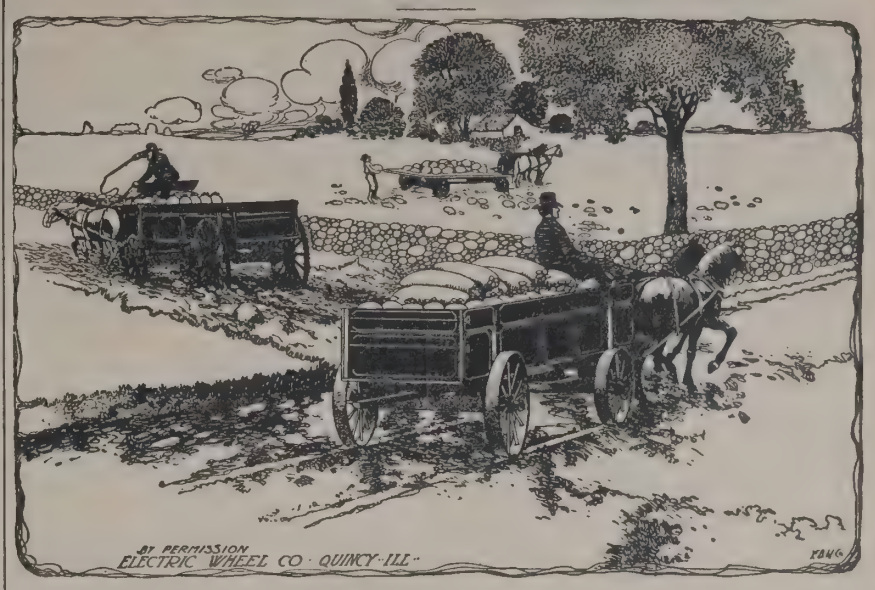
We thank H. B. C. for his encouraging report concerning corn and soy beans for silage.

Cement or Plank Floor, Which is Best for Cows ?—Building a Wooden Hoop Silo.—Absorbing Liquid Excrement.—Hauling Manure Direct From Stable to Field.

ED. HOARD'S DAIRYMAN:—I have been pleased and profited by your paper. Am engaged in dairying and stock raising. I put basement under barn last summer, which is 40x100 ft. with cement floor, but did not get slant enough under cows to carry water off readily into trench. Will have to raise it some. It can be done with cement or plank. Which is best for cows to stand upon ?

Am expecting to build a silo the coming summer, so have been much interested in the silo talk in your paper, especially Gould's wooden hoop silo, but the discription of same was too meager for me to get the idea in my head.

Barn is so arranged I can drive through horse stable, then back through cow stable, to take out manure. By so doing, horse manure absorbs all slop and liquids from cows.



Have been the first in township to practice drawing manure direct to the field, but my neighbors tell me, I will soon stop that, for they see the fertilizing qualities going to the river. A. T.

Snover, Mich.

Contrary to what has been a somewhat popular notion in recent years, HOARD'S DAIRYMAN has never approved cement floors for any kind of stock to stand or lie on. They are durable and sanitary, but in our judgment, more or less cold and unhealthful. We however, have always held ourselves ready to give up personal opinions when in conflict with the facts of experience. Years ago, the United States Government built a very expensive stable at Fort Leavenworth for cavalry horses, and laid down the most approved cement floor, but, after a few years' experience, discarded them. Quite recently also it has come to our knowledge that one or more experiment stations and some private dairymen, who had put in cement floors for their cows, have thought it necessary to cover them with boards or plank, all of which confirms us in the opinion that while cement may be used for passage ways and mangers, yet on the platform where the cow stands, plank is much to be preferred.

We have given in a recent number of the DAIRYMAN, what appeared to us to be quite full instructions for building silos with wooden hoops, or more particularly for constructing these hoops. After the hoops are constructed, they should be placed one above the other, properly spaced and supported and firmly staylathed in place while the inner lining is being put on.

ILLUSTRATION.

FOR GOOD ROAD MAKING.

At the Auditorium in Chicago, February 20th, the National Good Roads Convention assembled for its opening session. The National Highway Commission appointed by the President, consists of such distinguished members as Gen. Nelson A. Miles, Col. John Jacob Astor and Col. Albert A. Pope. The Governors of most of the States in response to the invitation, appointed delegates, and representatives were also present from every local Good Roads Associations of any consequence in the United States. An assembly constituted as this one was should have been able to shape some policy to bring order out of a very chaotic but all important subject. A most healthy sign was the presence of the strong hand of the General Government, heartily seconded by the different States. We cannot conceive of any field in which State or Nation can direct or encourage the spending of money which will bring to the great body of rural people such a direct and permanent good as the improvement of its highways. We illustrate the elementary principles of road making, namely, drainage, raising centers of roads and rolling. As to the rolling and packing of the road bed, if the purchase of heavy engines for the purpose, such as are used in cities and towns, be too radical a preliminary step, the convention would have adopted at least one good practical measure if it had passed a resolution advocating the general use of broad tired vehicles on the road. The same benefits are to be derived from it that flow from the use of the steam roller. And in its use the cost would be nothing to the county or township authorities, the mere use of such wheels, instead of wearing out the roads, do constantly improve them. Where the narrow wheels rut and furrow and lead to washing, the broad tires roll and make compact and permanent. It is only necessary to behold the road districts in regions where the broad tired wheel is in general use to at once become an advocate of their general employment. The illustration herewith well illustrates our meaning. We reproduce it by courtesy of the Electric Wheel Company of Quincy, Ill., who, by the manufacture of a wheel admirably adapted to the purpose we are considering, is doing much to further the cause of good roads all over this country. It will be apparent that the draft must be much lighter for the broad tired wheel than the narrow one even for the first tracking over a given point. All subsequent passings must continue to pack and improve the bed and, still further lessen the draft, while exactly the reverse is true of the narrow tire. If the practical experience of every farmer did not unequivocally settle this fact, the experiments made by the Experiment Station at the University of Missouri would place the matter beyond cavil.

COMMON SENSE
Calf Feeder

awarded Gold Medal at Pan-American Exposition. The only Feeder adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. More Common Sense Feeders are in use than all others combined. Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of Your Feeder, I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. Be Sure and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

O. H. MANUFACTURING COMPANY, DEPT. H, LYNDON, VERMONT.

Shoo-Fly THE ANIMALS' FRIEND

Kills every fly it strikes: keeps off the rest. Harmless to man or beast.

Trade Mark

This cow was a terror to milk prior to using ½ cents worth of Shoo-Fly. Had it been used earlier, she would not have lost milk and flesh to the amount of $14.00. The other cow was protected early and continued to give 18 qts. of milk daily through fly-time

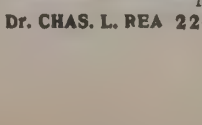
Shoo-Fly is the original stock protector used by the same dairy-men since 1885, after testing imitations. It prevents contagious abortion and other diseases, cures all sores, scratches, skin diseases, hoof ailments, etc. NO LICE in poultry house or any place it is sprayed. Beware of imitations that last only a few hours and make sores. If your dealer does not keep Shoo-Fly (made in Philadelphia, Pa.,) send us $1.00 for latest Improved Three Tube Sprayer and enough Shoo-Fly to protect 200 cows Cash returned if cows are not protected.

SHOO-FLY MF'G. CO. 1005 Fairmount Ave., Phila., Pa.

EDITOR knows from experience Shoo-Fly is O. K.

SENT out under positive guarantee. Money refunded if not satisfactory. No bolting food. Perfect digestion. All tinned—no rust.

KEYSTONE CALF FEEDER



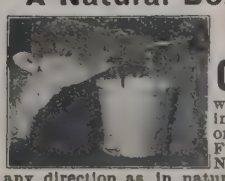
Patented under No. 721,384. Used in about forty experiment stations. Mass. Ag'l College writes as follows: Mr. M. T. Phillips, Dear Sir:—I write to say that the Calf Feeder is giving excellent satisfaction. We have found it to be all one could ask for in a feeder. It is easily cleaned and appears to be durable. Yours truly, E. A. JONES, Supt.

Complete with extra nipple, $1.50, express prepaid. Circulars free.

M. T. PHILLIPS, POMEROY, PA.

DR. REA'S IMPROVED CALF FEEDER

Established 1892.



Galvanized castings. Will not rust. Seamless rubber nipples, reinforced, cannot split. Makes fat calves. Price,

ONE DOLLAR.

Satisfaction guaranteed or money refunded. Booklet free.

Dr. CHAS. L. REA 220 E. 32d St., New York

"A Natural Born Sucker"

TAKES TO THE WHITFORD Calf Feeder without any "breaking-in." This is the only Ball-and-Socket Feeder on the market. Niple moves freely in any direction as in nature. The latest and most improved. Price $1.50 or $1.75 prepaid. Prof. W. L. Carlyle, Wis. Exp. Sta., Madison, writes: "Have used your calf-feeder and find it very satisfactory. I prefer the ball-and-socket arrangement to the stiff junction on others." Write for free circulars.

MAHLER BROS., 34 LaSalle St., CHICAGO, ILL.

RUPTURE CURED while you work You pay $4 when cured. No cure, no pay ALEX. SPEIRS, Box 846, Westbrook, Me

Dairying in North Dakota.

Expense of Operating a Skimming Station—Delivering Cream a Distance of Eighteen Miles—Alfalfa in North Dakota.

ED. HOARD'S DAIRYMAN:—Interest in the cow as an asset of the farmer is developing in this state. This interest in the cow, dairy cow, is manifested in the large number of creameries being organized throughout the state. This is gratifying to note as it indicates that North Dakota has reached that stage in her development where her farmers realize that it is important to change their methods of farming, just as the farmers of Illinois, Iowa and Minnesota, in their time found that they could not go on forever raising small grains exclusively, and gave more attention to the cow. The results in these states show the wisdom in changing their methods of farming.

That dairying is a profitable branch of North Dakota farming is no longer a doubtful question, the success of the creameries now in operation plainly demonstrate. However we have much to learn in this line, in the selection of breed of cows best adapted to our conditions and the proper feeding and care of same to give best results.

We have organized a creamery at this point and expect to have same in operation sometime in April. We have about four hundred cows pledged.

I should like to ask the Editor's opinion on a question or two which have come to our attention if it would not presume too much on his good will.

About ten miles, possibly a lesser distance, there is a group of farmers who have among them about three hundred cows and who would like to patronize our creamery if they could. We have considered the advisability of establishing a skimming station among them.

What should be the cost of maintaining such a skimming station, and what conditions must prevail to insure the successful maintenance of such station?

Another question: Can cream be brought to the creamery in proper condition a distance of 18 miles over a country road? Cream to be brought every other day. There are four farmers (brothers) about that distance from here, who have between them about one hundred and twenty-five cows, and they are desirous of taking their cream to our creamery. These men are intelligent farmers and are aware of the importance of having the cream reach the factory in proper shape; in fact, one of them has been a dairy student at the North Dakota Agricultural College.

These farmers all have hand separators.

The undersigned esteems HOARD'S DAIRYMAN very highly, and if you will send a bunch of sample copies, shall be pleased to distribute same among the farmers. K. O. A.

Kathryn, No. Dak.

P. S. It just occurs to me that it might interest you to learn that alfalfa will grow in this part of the country.

In 1901 Mr. Louis Kjelland, of Green Township, Barnes County, North Dakota, sowed one acre of alfalfa as an experiment. That season he cut one crop from this, getting about one ton. During the season of 1902 he cut this patch twice, each cutting yielding a little better than one and a half tons, or three tons in all. The stand is good, and Mr. Kjelland expects to get a much better yield next year.

It is fortunate for the Dakotans that they are turning their attention to dairying and stock raising at an earlier relative date than did the farmers in Wisconsin, Illinois and Iowa. It is not alone that exclusive grain cropping renders the soil unproductive, but it appears to have a deteriorating influence upon the farmers, and this for reasons that might be explained but which it is unnecessary to enlarge upon in this connection. General farming is not only best for the soil, but for the tiller of the soil as well, and there is nothing that can compare with dairying in rounding out and completing the ideal general farmer. It is quite common to speak of the dairy farmer as a specialist, and in one way he is, because to secure the best results in dairying, he must have special skill and special adaptation, but the true dairymen is none the less a general farmer. He must plow and sow and plant and harvest and feed. He must keep a variety of stock—in fine, there is no branch of farming that does not come under his supervision to a greater or less extent.

The expense of maintaining and running a skimming station will, of course, depend very much upon local circumstances, such as the cost of fuel, the rate of wages to be paid and the expense of transporting the cream. Skimming stations in this vicinity are run at an expense of from $800 to $1,000 a year, exclusive, in most cases, of transporting the cream. Some stations are fitted up with a complete outfit,—boiler, engine, separators, churns and so forth—so that they can be operated as creameries in case of emergency. Others are simply furnished with a boiler and a turbine separator, doing away with the expense of installing and running an engine.

It is practicable with proper care to transport cream 18 miles over a country road and deliver it only every other day in fairly good condition, but this implies not only a high degree of cleanliness in caring for and milking the cows, a proper care of the milk and cream, but also especial care in transporting it. Not only should it be transported in jacketed cream carrier cans, but these also should be carefully protected from the heat of summer, and the cold of winter.

Returns From Whole Milk and Cream.

"A" can sell his whole milk for $1.25 per 100 lbs. He can also separate it and sell his cream for 20c per lb. butterfat; and skim milk for 15c per 100 lbs. His milk tests 3.6. Which will bring him in most money, whole milk or cream and skim milk? A.

Halton Co., Ont.

The cream at 20 cents per pound for butter fat would bring 70 cents per hundred pounds of milk; adding 15 cents for skim milk would be 85 cents, total returns. Selling the whole milk brings $1.25 per hundred pounds, which is a difference of 40 cents per hundred in favor of the whole milk. This is of course provided that there is no added cost in disposing of the whole milk above that given in the above statement.

Measuring and Weighing Cream for Testing.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of April 3rd, 1903, page 175, in answer to inquiries you say: "Measuring cream for testing with a pipette is not an accurate method and the calculated results may be quite different from the creamery returns."

The "rules for a Babcock tester" makes no mention of any other way of measuring cream for testing than with a pipette. Please give in the DAIRYMAN your reasons why the pipette is not accurrate, and also give the details of the method that the creamery uses. L. B. A.

Vashon, Wash.

The pipette used in the Babcock test was never intended to measure anything but milk, skim milk and whey.

These products contain comparatively a small percentage of butter fat and consequently the pipette measures the fat very accurately. Cream being very rich in fat, also thick and heavy in body, cannot be measured accurately, owing to its containing air and also from sticking to the sides of the pipette. The error introduced this way amounts, in some cases, to over one per cent in thick cream. For these reasons it is always advisable to weigh the cream when it is to be tested with the Babcock. This is done by means of a pair of accurate scales that can be obtained from dairy supply houses. The cream bottle is balanced on the scales, 18 grams of cream is weighed into it and the testing continued as with milk.

PETER C. KELLOGG, AUCTIONEER
is instructed by
MR. FRANK S. PEER, of Ithica, N. Y.
to Sell at Auction, commencing
TUESDAY, MAY 12, 1903,
in or near New York,
Upwards of ONE HUNDRED HEAD OF IMPORTED
JERSEY CATTLE
of Island and English Breeding
Selected by him for the American Market.

The English contingent was obtained from the very celebrated Chestall Herd of J. Reid Walker, Esq., Rugeley, England, in choosing which Mr. Peer had the valuable advice and assistance of Mr. Frank Sugden, Agent of the Chestall Estate.

Among several very valuable bulls in the importation are the world-famous GOLDEN FERN'S LAD and the very exceptionally bred BROOKHILL FOX, by Flying Fox out of Brookhill Rose 2d. Mr. John Thornton, of eminent authority, pronounced these the best two bulls in England. Many Island breeders regard the former as the greatest Jersey sire that ever lived. There are eight daughters of Golden Fern's Lad, and numerous get of such highly approved sires as Napoleon Bonaparte. Eminent 2d, Forfarshire, Hamley, Golden Lad 2d, Orlando, Flying Fox, Financial King, etc.

☞ The exact place of Sale and other particulars will be announced later.

PETER C. KELLOGG, 107 John St., New York.

MUST BE
SACRIFICED
Having concluded to retire from the dairy business, and having sold my farm, possession to be given in sixty days, I offer for sale my herd of cows at a price around half real value. I have
20 COWS AND A BULL
bought at H. G. McMillan sale at prices ranging from $70 to $150 each. I have five coming two-year-old heifers in calf by Trustee's Gold. These cattle have rich strain of Diploma, Brown Bessie, and St. Lambert blood. They are heavy milkers, and average annual test of the entire herd is nearly 6 per cent. In size, beauty, and performance at the pail there is nothing like them. I will take $70 per head and give 12 months' time on a good note at 6 per cent.
B. C. WELCH, Elsberry, Mo.

VALLEY FARM Is offering some good bargains in young bulls from 1 mo. to 2 yr. old. Also B. P. Rock Cockerels, $1.25 each. Write
FRED STUBLEY, Black Earth, Wis.

PROSPECT HILL JERSEY HERD.
Mature cows yearly records are from 405 lbs. to 740 lbs. butter. YOUNG STOCK FOR SALE. Come and see them. Tuberculin Tested. F. H. SCRIBNER, Rosendale, Wis.

BROTHERTOWN
Stock Farms
DEANSBORO, N. Y.
THE LARGE OFFICIAL RECORDS, made by members of our herd, emphasize the fact very strongly, that our breeding and selection has been most correct. If you are looking for the highest production, combined with choice breeding and individual merit, it will benefit you to place orders for breeding stock of either sex with us. We will give your wants careful attention. Prices reasonable.
McADAM & VON HEYNE

Advanced registry Holstein-Friesians of leading families at reasonable prices. Small calves of both sexes cheap. JOHN B. IRWIN Station D., R. 1, Minneapolis, Minn.

For Clean Milk and Healthful Milk Products.

A Wisconsin Law.

In order "to prevent the sale of unclean and unsanitary milk and the use thereof in the manufacture of food products, and to prohibit unclean and unsanitary conditions of creameries, cheese factories, and milk dealers' establishments or outfits," the Wisconsin Legislature has passed and a Wisconsin Governor has approved a law which reads as follows and is its own best commentary:

Section 1. Milk which shall be drawn from cows that are kept in barns or stables which are not well lighted and ventilated, or that are filthy from an accumulation of animal refuse, or from any other cause, or from cows that are themselves in a filthy condition; and milk in or from cans or other utensils that are not kept in a clean and sanitary condition, or milk to which has been added any unclean or unsanitary foreign substance, is hereby declared to be unclean and unsanitary milk; provided that nothing in this act shall be construed to prohibit the sale of pasteurized milk or cream to which viscogen or sucrate of lime has been added solely for the purpose of restoring the viscosity, if the same be distinctly labeled in such manner as to advise the purchaser of its true character.

Section 2. No person, firm, or corporation, shall knowingly offer or expose for sale, or sell, or deliver for sale or consumption, or to any creamery or cheese factory or milk condensing factory, or have in his possession with intent to sell any unclean or unsanitary milk.

Section 3. No person, firm, or corporation, shall knowingly manufacture for sale any article of food from unclean or unsanitary milk, or from cream from the same.

Section 4. All premises and utensils employed for the manufacture or sale or offering for sale of food products from milk, or cream from the same, which shall not be kept in clean and good sanitary condition are hereby declared to be unclean and unsanitary. Any city milk dealer, or any person, firm, or corporation furnishing milk or cream to such dealer, or the employee of such milk dealer, and any person, firm or corporation or the employee of such person, firm, or corporation, who operates a creamery, cheese factory or milk condensing factory, or manufactures, re-works or packs butter for sale as a food product, shall maintain his premises and utensils in a clean and sanitary condition.

Section 5. Any person, firm or corporation, who receives any milk or cream in cans, bottles or vessels, which has been transported over any railroad, or boat line, where such cans bottles or vessels are to be returned, shall cause the said cans, bottles or vessels to be emptied before the said milk or cream contained therein shall become sour, and shall cause said cans, bottles and vessels to be immediately washed and thoroughly cleansed and aired.

Section 6. Whoever violates any provision of this act shall, upon conviction thereof, be punished by fine of not less than twenty-five dollars nor more than one hundred dollars for each and every offense and, in default of payment thereof, shall be imprisoned not less than thirty days nor more than sixty days.

Good Record for a Small Michigan Herd. — Soiling Crops for Fall Months.—Raising Calves on Whey.

ED. HOARD'S DAIRYMAN:—I have been a reader of your paper the past two years and it has been a great help to me in caring for my small herd of six cows, which consisted, last year, of one pure bred Holstein, one grade Holstein and four grade Jerseys.

I commenced weighing the milk from each cow February 1, 1902, and to February 1, 1903, they gave me 38,552 pounds; the first mentioned giving 8,221, the second 10,827, and the others 6,672, 6,398, 3,162, 3,272. The last two were two-year-olds, which came fresh May 15th and June 11th. The pure bred Holstein had been milking a year when I commenced weighing her milk, and came new Sept. 24th. The grade Holstein came new February 8th and milked to December 10th. Their milk was tested, but not often enough to give a correct average, but would not be far from 3, 3.5, 3.9, 4.6, 4.8, 5.2, in the order above mentioned.

I fed a year ago a ration made up from clover hay, corn stover, ground oats, corn-and-cob meal, bran and oil meal. I fed no grain during summer and had but little pasture. Fed clover, oats and peas and corn in their season. The past winter it has been clover hay, corn "unhusked" but not much corn, oats, oil meal and bran.

My winter rations have been rather expensive having no silo, but I intend building one in the near future.

I would like some information as to soiling. What can I sow to feed during October and November? I got along nicely last year until frost came about October 1st. Corn is often cut by frost before this time in this locality.

I intend keeping several more cows another year if my present plans mature. A gentleman of some twenty years' experience in cheese making and myself are building a cheese factory. Will be ready for business in a few days. We have for competition a process butter factory which has a record that would not look well on paper.

We have the promise of a large portion of the milk and the encouragement of many of the best farmers. But few have ever sent milk to a cheese factory and are at a loss to know how they are going to raise their calves. Any information on this will be thankfully received.

We want every patron to read HOARD'S DAIRYMAN and wish you would send us a few sample copies occasionally, and we will do our best to have them read and get as many subscriptions as possible.

Vassar, Mich. W. T. L.

Evidently this correspondent has the dairy temperament, which may be otherwise expressed as the ability to absorb and assimilate sound dairy teachings and turn them to good account.

Barley and peas are probably the best frost resisting crops that can be grown. Sow from the 5th to 10th of August, 1½ bushels of each to the acre, and the crop will probably furnish feed through the month of October and, with extra favorable weather, for a part of November. A good silo, however, is the proper solution of this problem.

To raise calves satisfactorily on whey is not an easy matter. See the answer to an inquiry concerning the feeding values of skim milk and whey on page 201. If one should add 10 lbs. of linseed oil meal to 100 lbs. of whey, he would have an approximation to whole milk in chemical analysis, but it may be doubted whether such a combination would be satisfactory. We would advise commencing with much less oil meal and watch results and be governed by them. It would be well also to try a little of the new dried blood feed, which is rapidly making friends among calf raisers.

A Source of Danger.

At the recent meeting of the Wisconsin Dairymen's Association, Prof. Henry,

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

in an address on the Wisconsin feed stuffs laws presented some facts that were enough to alarm any man who cares for clean farming and a clean farm.

In speaking of the adulteration of wheat bran he said it often contained unground weed seeds to a harmful extent, and cited as an illustratian of the fact, a car of bran that was shipped into Wisconsin the past year, which the dealer held till he could send samples of it to the experiment station for examination. What that examination revealed was: A pound of that bran contained 28,000 pigeon-grass seeds, 16,000 wild buckwheat seeds, 3,800 flax seeds and 5,100 various other weed seeds, a total of 52,900 seeds per pound of bran. Think of feeding ten or twenty tons of such bran to the cows upon a farm and using the manure to enrich its fields!

Eternal vigilance is the price of clean farming—vigilance as to what we feed as well as vigilance in thoroughness in culture. If bran can not be bought without being adulterated with weed seeds, let them be ground so finely before the bran is bought by us that we cannot see them. Then, even though they do the cows no good (some of them have some feeding value) they will do the land no harm.

Look well to the purity of the bran you buy.

One Cow Better Than Three.—Feeding Skim Milk to Chickens.—A Question as to Inbreeding.

ED. HOARD'S DAIRYMAN:—When I bought my farm it had a bunch of poor cows. I replaced them with Guernseys and Guernsey grades. One of my Guernseys gives as much as three of the old, ordinary cows. She does not eat as much, take up as much room, or require the attention that the three did. She cost as much as the three did, and some of these fellows who don't read thought I was a fool to pay so much for a cow. HOARD'S DAIRYMAN is responsible for my getting good cows.

Feed skim milk to your chickens. Use it instead of water in making your mash for them and you will be surprised at the growth of the young chickens. It is worth at least 25 cents per 100 lbs.

Is it inbreeding too close to breed a heifer to her sire, if both animals are in good health? J. G. H.

Milwaukee, Wis.

The experience of this correspondent is not unlike that of innumerable others who write us. Other breeds in other hands will show similar results, one good cow not only giving more milk and butter than three poor ones, but doing it with a great saving both of feed and labor. The evidence is so conclusive that it is a marvel to us that so many would-be-dairymen continue to try to do business with poor cows. It cannot be said that all of them are ignorant, but some way they lack the courage to get out of the old ruts. There has been no time in past years when the outlook for profitable dairying was more promising than it is now; no time when it would pay better to dispose of the poor cows and substitute good ones.

Under the conditions named, we do not hesitate to breed heifers back to their sires. Indeed, many times this is the most desirable plan to pursue. With us the question of in-breeding is purely a question of the relative merits of the animals as such, and not at all a question of relationship. We would, therefore, breed to the best sire obtainable, unless there were special reasons for wanting to introduce some new blood elements.

The Contrast

ED. HOARD'S DAIRYMAN:—I have just taken notice that my subscription has expired. It has been sometime since I saw a wrapper and of course failed to see the date on the label. I am glad you did not stop the paper as I would not like to miss one issue. I will enclose money order for $1.00 to renew my subscription to the DAIRYMAN. Hoping I will look closer next time. JACOB M. HERR.

Allen, Pa.

The old saying, "It takes all kinds of people to make a world" is seen to be very true in the DAIRYMAN office. Today we received two letters from Pennsylvania, one blowing us up in great style for our ideas on dairying and declaring the paper was not worth five cents a year. As a contrast we append the above letter from an appreciative friend of the paper who evidently possesses the ability to get something out of it.

Dog or Sheep Power for Running Separators.

ED. HOARD'S DAIRYMAN:—Have any readers of the DAIRYMAN used a dog or sheep tread power in operating a churn and cream separator, and is a tread power a success? Will a person have to watch the sheep or dog to keep them at work? T. L. G.

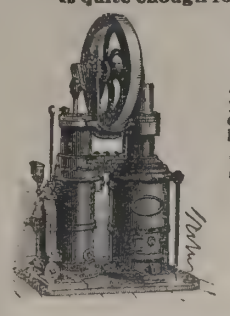
Lenawee Co., Mich.

Reports indicate that they work well. As to watching the animals, that of course will depend somewhat on the nature of the one at work; the average dog will keep at work, but the exception will need watching.

Sweep Power for Separators.

Ear Markers—Information Wanted.

ED. HOARD'S DAIRYMAN:—In the past year the question was asked if a sweep power could be successfully used to run a separator. The Editor answered, no. In the following number a reader answered that he had used such a power for a long time successfully and offered to give information how it was used. I have watched the DAIRYMAN for this information but have never found it.



In a former number was also stated how animals could be marked by notches in the ear and it was stated that an instrument could be obtained from some address to make these notches. In looking through the index of last volume I cannot find anything in regard to it. Can you furnish me the information how to make these marks to keep a record and the address of the manufacturer who manufactures those instruments? C. H. G.

Mauston, Wis.

Cream SEPARATORS

All about them and other things for the dairy and creamery. A. H. REID, Philadelphia.

$28 FREE

FOR A TESTIMONIAL

You can have ripe tomatoes June 15th, ripe melons July 1st, new potatoes and cucumbers May 15th. All other vegetables or flowers as early by using Gold Mine Hot bed. It protects all kinds of plants from frost, cold raw winds and storms. Keeps off the bugs, insects, cutworms. Stimulates plant life in such a manner as to make them grow three times as fast. Indorsed and recommended by every agricultural paper in the United States, and by every farmer that has used them. There is not a Tool or implement that the farmer buys that will bring him in as large returns each year as this. It will pay for itself forty times a year, with proper usage.

We have reduced the price from $1.50 per dozen to 85 cents, for immediate acceptance. Sold on the same guarantee to give satisfaction as plows, binders, and mowers are sold, or money refunded. When you find they are better than you expected them kindly send us a testimonial. Next year you will want more of them; we will reciprocate your kindness with a present.

We will give 200 Gold Mine Hot Beds to the person sending in the best report; 100 for second best; 50 for third; value $28, and pay all charges to destination. Premiums paid in November. Points considered—Earliness yield, amount of money made, with one dozen. Please do not delay your orders.

Reference by permission: Commercial Bank, Greentown.

W. M. WOODWORTH, Greentown, Ind.

THE illustration on this page is of the imported cow, Rowena's Daisy, one of Case & Walker's Jersey Isle Stock Farm Herd, which is to be sold at auction, Rushville, Ind., April 28th. She was dropped June 8, 1896, and was known on the Island as Rowena's Daisy, P. 7414, H. C., which being interpreted means that she is descended from pedigree stock, and upon examination for admission to registry, she was highly commended by the expert judges. A reference to the illustration on page 198, giving "our ideas of the dairy form" as graphically set forth several years ago, is sufficient evidence that it is something more than mere compliment for HOARD'S DAIRYMAN to say that it "highly commends" the findings of those Island judges in the case of this cow. We purposely gave our ideal cow a somewhat ill-shaped udder, because it often happens that splendid dairy cows do not have perfect udders, and therefore for practical work in the dairy, a cow excellent in other respects should not be condemned for the reason that her udder is not of faultless contour. Otherwise there is a very marked similarity in the two illustrations, and it follows that whoever secures Rowena's Daisy will have what HOARD'S DAIRYMAN esteems a model cow.

ROWENA'S DAISY 161056, a Granddaughter of the World-famous Golden Lad.

Silo and Silage Queries from Washington.

ED. HOARD'S DAIRYMAN:—Will you be kind enough to give me dimensions of silo for about six cows or 10 head of cattle. I saw some time ago in HOARD'S DAIRYMAN a specification how to build a silo. I like to build it myself and can not very well build a stave silo. I like to round the corners, for I think it will be better. Will a single wall made out of flooring do? Would it be better to use cedar instead of fir flooring?

I remember a plan of a round corner silo, but forgot how long those wedges or ties in the corners will have to be, and how close together those 2x6 need to be. As I understand, I don't need any 2x4 uprights for studding, except to hold up the 2x6 hoops or frames, in place till wall is nailed on.

Can I put clover in silo when it is raining or wet with dew. I am only to put clover in silo, as I can not very well cure it in June when it by rights should be cut. Can I fill silo all alone by myself, that is, does it matter much how fast you fill a silo? Will cows do well on clover silage and clover hay without grain, as grain is very high here and roads in winter time not fit for travel? Do you advise to salt clover in silage, and how much salt? Do you think 18 feet high will do? I don't like to make it too high on account of filling, for it don't pay me to buy machinery for filling, nor cutting silage. I will have to put clover in whole. I intend to build silo in barn. J. N. N.

Jordan, Wash.

It is a pretty difficult matter to estimate the weight of clover silage, or to determine the necessary capacity of a silo for clover, especially where the clover is put in whole as is contemplated by our inquirer. It would be well, we think, to provide sufficient capacity to feed each animal from 30 to 40 pounds of silage per day, and this for ten animals would be from 30 to 40 tons for 200 days, and would require a silo, approximately 12x16 feet or 14x14 feet and 18 feet deep.

The ties or braces across the corners should be from 3 to 4 feet long and for uncut clover silage we should prefer the longer length. For a silo 18 feet in depth, we would place a second girt two feet above the lower one, the third, two and one-half feet above the second, the fourth, two and one-half feet above the third, then make the next interval three feet and the next four feet. Whether cedar or fir would make the better lining for the inside will depend upon which of these swells and shrinks the most, and this is a matter upon which we have no information. A single wall or lining made of matched flooring will suffice.

From reports received, it seems to be practicable to put clover in a silo when it is very wet, but for our own part, we should prefer that it be not soaking wet. A goodly number of people put salt on their silage and in their hay mow. We never have practiced it, and are somewhat prejudiced against it. We think that cows will do fairly well on clover silage and clover hay alone, but better and with more profit if they have some grain in connection.

Patrons Award Fund.

Creamery Package Manufactnring Company Adds $100.

Following is the record of subscriptions to date and conditions of the offer as regards the Patrons' Award Fund:

"Recognizing the importance of rousing an interest among the creamery patrons in delivering better milk, we, the undersigned, agree to pay towards a fund for "Patrons' Award" to be given as prizes to the patrons of the creamery whose buttermaker secures the highest average score in the National Creamery Buttermakers' Association yearly test for 1903 on the following conditions:

"At least $500 shall be subscribed and given as a premium to the patrons of the highest scoring creamery. If any more money is subscribed, it shall be given as a second and third premiums. Each buttermaker shall at once take steps to inform all his patrons, as soon as $500 is subscribed, and shall also decide whether the money, in case of winning, shall be divided equally among his patrons, or whether he will devide it only among those of his patrons who have delivered the best milk.

"In the latter case he shall, without notice to his patrons, make at least four fermentation tests of the patrons' milk during the balance of the year.

"We make this subscription without prejudice to the regular fund for the National Creamery Buttermakers' Association."

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the **"OTTO"** is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our **Volume Governor** gives uniform speed. Our **Acme Mixer** is the most positive and economical on the market. Our **Hand Starting Lever** starts engine with least effort. All bearings of **Phosphor Bronze.** Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

Calf Scours Don't let your calves die from this disease. You can save them by using Hood Farm Calf Scour Treatment, which consists of Calf Scour Cure, a liquid preparation which checks the scours, and Digestive Powder, a preparation of pepsin, which aids digestion, creates an appetite and keeps the calf from becoming stunted in growth.

HOOD FARM

Calf Scour Treatment

SAVES THE CALVES.

At Hood Farm, Lowell, Mass., in one year, there were 83 cases of scours. Every calf was treated with these remedies and all but 3 were saved. Formerly we lost 75 per cent. of all calves affected.

Two sizes of each remedy, $1 and $2.50, large contains four times the quantity of the dollar size. Prepaid to any railroad express point in U. S., 25 cents additional.

Address C. I. Hood Co., Lowell, Mass.

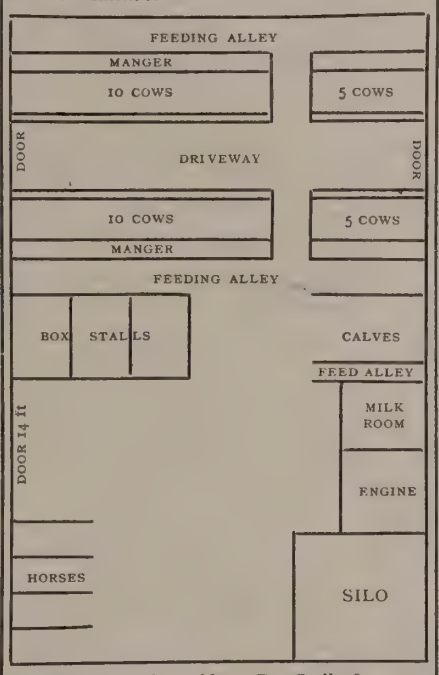
THE HOMER YOUNG CO. Ltd. (Makers) Toledo, O

An Oregon Barn Plan.

ED. HOARD'S DAIRYMAN:—1. Have a barn 56×80 ft. Is nothing but a shell but want to fix it for thirty cows and three horses. The roof is sufficiently elevated to build a 28 ft. silo inside the barn if you think it better indoors than out.

Please submit plan for stalls, alleys, silo and milk house, also position of gasoline engine to be used to run separator and cut silage.



2. What is the value of skim milk when fed to cows, as compared with bran?

3. Is there any danger of cows forming the habit of sucking each other if they are fed skim milk?

4. Grain is not grown in this part of Oregon, consequently we have no bedding, and none is used except what hay the cows waste. As bare floors are not very comfortable, can you suggest a solution? Our winters are very rainy but not cold and I thought it might be practicable to have an enclosed yard or shed for the cows to stay in, allowing them in the barn only while being milked. R. G. W.

Marshfield, Ore.

The annexed diagram is the best we can do in the way of planning the division of such a structure. There ought to be some way to provide bedding for these cows. Shavings from planing mills are used in many places. Not only do the cows need bedding but the land needs it in the manure.

Feeding Alley,	4	feet	wide.	Box Stalls,	8x12.
Mangers,	2	"	"	Milk Room,	10x11.
Gutters,	1	"	"	Engine Room,	10x12.
Driveway,	8	"	"	Silo,	18x18.

2. We do not know that this question has ever been answered by carefully conducted experiment. Some dairymen consider skim milk very valuable for this purpose, but chemical analysis scarcely support their claims.

3. No.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Caked Udder.

I have a Jersey heifer with second calf, one of her teats seems to be drying up, that quarter is getting hard. We had trouble with it after her first calf, but she gave some milk from it; have been using lard and vaseline on it, but it does not seem to help any. L. G. C.

St. Paul, Minn.

ANSWER.

Take re-sublimed iodine, 1 ounce and lanolin 16 ounces. Mix and rub well into affected quarters for 5 or 10 minutes after each milking.

Horse Owners! Use

GOMBAULT'S

Caustic Balsam

A Safe, Speedy, and Positive Cure

SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.* Every bottle sold is warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars.

THE LAWRENCE-WILLIAMS CO., Cleveland, O.

"SAVE-THE-HORSE" —TRADE MARK— **SPAVIN CURE.**

POSITIVELY AND PERMANENTLY CURES

Bone or Bog Spavin, Ringbone (except Low Ringbone) Curb, Thoroughpin, Splint, Capped Hock, Shoe Boil, Wind Puff, Weak or Strained Tendons or Lameness.

FROM A REPUTABLE AND NOTED TRAINER

GLENVILLE DRIVING PARK, CLEVELAND, OHIO.

For the enclosed $5.00 please send me one more bottle of "Save-the-Horse." It is doing great work. Respectfully, MILLARD F. SANDERS.

HARTLAND, LIVINGSTON CO., MICH.

Find enclosed money order for $5.00, for which send me another bottle of "Save-the-Horse" spavin cure as it has done all you claim for it for me With the bottle I bought of you I took off a curb, spavin and a side bone on a 3 year old mare that other spavin cures refused to help in the least. I consider your spavin cure the best on the market. E. M. PARSHALL.

HOWICK, QUEBEC.

I had a mare suffering from a bone spavin and very lame. I concluded to try a bottle of "Save-the-Horse" and at the expiration of six week's treatment she was free from all lameness and I consider it one of the greatest compounds made. DAVID BARRINGTON.

EDGEWATER, N. J.

Enclosed find check for $5.00 for which you will kindly send me by Wells-Fargo Express one bottle of "Save-the-Horse" as soon as possible. The horse I have been treating with "Save-the-Horse" went sound and I sold him. The last I heard from this horse he was still going sound and working every day, and I think he will stay sound. The bottle I am ordering now I will use on another horse that has a pair of spavins and a curb; he does not go very lame, but walks on his toes and I think "Save-the-Horse" will bring him around so that he will walk all right. Very truly. OTTO MEYER.

The fire iron is uncertain and invariably only aggravates the disease or injury; blistering is less effective than the fire iron, and both necessitates laying up the horse from four weeks to two months. Arsenic, mercurial and poisonous compounds produce irreparable injury

"Save-the-Horse" eliminates all these factors. Horse can be worked continuously. Cures without scars, blemish, or loss of hair.

It can be applied at any time, anywhere, any place, and in all conditions and extremes of weather—hot or cold And no matter what the age, condition or development of the case or previous failures in treating, the concentrated penetrating, absorbing power of this remedy is unfailing.

$5.00 PER BOTTLE.

Written guarantee with every bottle constructed solely to satisfy and protect you fully. Need of second bottle is almost improbable, except in rarest of cases. Copy of guarantee sent upon application.

IF YOU HAVE A CASE DIFFERENT FROM INSERTED IN OUR BOOKLET OR ADVERTISING WRITE US.

We will advise you frankly as to the possibility of the remedy effecting a cure. Give explicit particulars, give the veterinary's diagnosis, if he is competent—inform us fully as to the age, development, location of swellings, lameness, action and previous treatment.

$5.00, all druggists and dealers, or sent express prepaid.

TROY CHEMICAL CO., TROY, N. Y.

BLACKLEGOIDS

BEST PREVENTIVE OF BLACKLEG.

Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each **Blacklegoid** (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. **Blacklegoids** are sold by druggists; *ask for them.*

Our newly printed eight-page folder on the "Cause and Nature of Blackleg" is of interest to stockmen. Write for it; it is free.

O. H. MFG. CO., Dept. H, Lyndon, Vt.

A New York Herd Report.

ED. HOARD'S DAIRYMAN:—Having read a number of herd reports in your valuable paper, I will give you the report of my herd for 1902, consisting of eight thoroughbred Holstein cows, seven heifers and one full age cow.

I make butter and put it up in pound prints, wrapped in parchment paper, and have regular customers by the year at 25 cents per pound.

Cash received for butter	$571.00
Two calves sold	75.00
Six calves raised, valued when dropped	150.00
Skim milk and buttermilk at 20 cents per 100 lbs	110.00
Total amount	$906.00
Average per cow	$113.25

The value of calves raised may seem rather high to a good many of your readers, but I would not take three times the above named amount for some of them. Three and four years ago I sent the milk from nine "scrub" cows to a cheese factory, and from the cash received from factory, calves vealed and raised and butter and milk consumed in family, they did not pay only about $400 for the year, or $44.44 per cow.

About that time I commenced reading the DAIRYMAN and resolved to do better. If I was to milk cows all my life, I would have something that would pay their board and mine, too. So I disposed of the "star boarders" and invested the proceeds in some registered Holstein-Friesian cows, and when I look over the yearly report, I find there is a great difference on the good side.

I think, as J. M. G., Alderley, Wis., does, let there be more herd reports.

I can't see why more dairymen do not take the DAIRYMAN and learn more about their business. I think a great many of them are afraid they will find out how they are situated.

I am feeding my fresh cows a ration of 35 lbs. corn ensilage, 15 lbs. alfalfa hay, 5 lbs. corn meal. Can you suggest any grain that will improve the ration?

Portageville, N. Y. A. R. M.

The ration reported seems quite large to us, but possibly it is none too large for growing heifers of this large breed. Otherwise we have no suggestion for improving it.

Cow Peas or Soy Beans With Corn for Silage.

ED. HOARD'S DAIRYMAN:—Several of our local dairymen, including myself, are anxious to raise crops on our farms that will make a balanced ration for dairy cattle. Some of them are going to try southern cow peas, some soy beans, and some alfalfa. The peas and beans are to be planted with the corn, harvested with the corn binder and put into the silo. The alfalfa is to be cut and cured as hay. We fear the cow peas will lie too close to the ground to be taken up by the corn binder. We think the soy beans will answer our purpose better. Taking our latitude into consideration, which will be the best for us to try, cow peas or soy beans? If we could silo the common corn field beans that grow so plentiful in our latitude, we would surely have the feed problem solved.

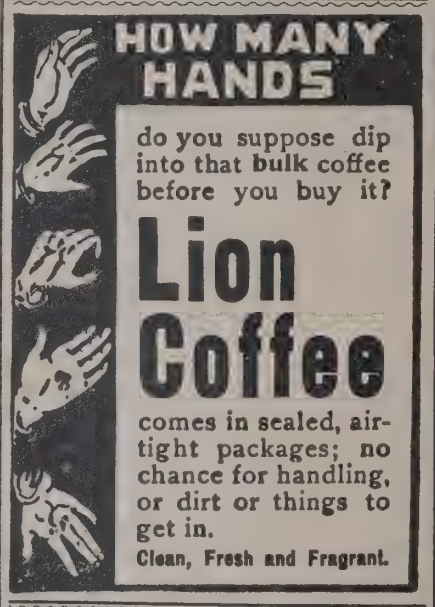
If cow peas or soy beans are planted with the corn, will they mature with it?

Liberty, Ind. T. C B.

There are not facts enough known as yet to determine which is to be preferred, soy beans or cow peas. Concerning the latter see the communication from J. N. M. on page 77, and concerning the former see the communication in this issue from H. B. C., Rochester, Mich.

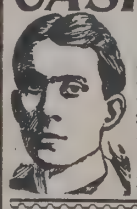
Suggestions for Remodeling a Quebec Stable.

ED. HOARD'S DAIRYMAN:—I am enclosing you a plan for a stable that I have on a farm recently purchased. The floor of this stable is made of hemlock plank. I have to renew it and am going to put in cement the coming summer. I want stabling for fifty cows and thirty head of young stock. The manure at present is thrown behind the cattle and drawn out when convenient. I have been thinking of building an addition for a manure tank or shed. I have also to build a hog pen. Would you be kind enough to give me some ideas as to the best method of arranging the cattle stalls, also the care of the manure and would it be better to build the hog pen separate from the stable, as I want to arrange for a boiler in the hog pen to cook feed for hogs.



I am a poor man, but would like an up-to-date stable. Any suggestions that you may be able to give me in regard to the above, will be greatly appreciated.

Montreal, Que. T. K.



The plan sent us shows a stable 48x98 feet, inside measurement, with a row of double stalls on either side of a central feeding alley 12 feet wide, which leaves a space 12 feet wide behind each row of cows. In remodeling this stable, we suggest a feeding alley 5 feet wide on one side then 6 feet for manger and standing platform for 25 cows, then a drop or gutter from 1 foot to 1 foot 6 inches wide, then a driveway 8 feet wide, then another drop or gutter, then 6 feet for platform and manger for 25 cows. We have now appropriated 28 feet in width and have provided for the 50 cows, allowing 3 feet 6 inches for each cow, and passage ways same width at either end and in the center. The remaining 20 feet will afford a feeding alley 7 feet wide, allow 5 feet for manger and standing platform for young stock, and leave 8 feet for driveway. Probably not more than half the full length of the stable will be required for young stock and there will remain a space 49 feet long and 13 feet wide for box stalls and feed bins.

As will be observed, all the space has been appropriated for cattle, which necessitates a separate structure for the swine, and this is desirable from every point of view.

In remodeling the stable, we cannot urge too strenuously that ample provision be made for light. There should be at least one window, containing six lights, 8x10 or larger, for every two cows. Also, it is important as well as profitable to secure effective ventilation. Possibly the the winter snows in the vicinity of Montreal will preclude hauling the manure to the fields direct from the stable, and if so, a shed for storing it will be a good investment, and a litter carrier, suspended from an overhead track, will be found an almost indispensable addition to the plant.

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a 320 acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

200,000 ACRES TO SELECT FROM

We own 40,000 acres in Red River Valley, in Marshall and Kittson Co's, Minn. and in Walsh and Grand Forks in N. D. 15,000 acres in LaMoure, N.D. HOARD'S DAIRYMAN.

Practical Dairying.

Address of Mr. L. S. Dorsey, of Moro, Ill., before the Madison County Farmers' Institute?]

Few words are abused as much as the word "practical." To be practical is to be capable of turning a thing to good and profitable use. So many people, especially farmers and dairymen, "know it all," and unless one's experience is identical with theirs, it does not count for much with them.

It is amusing to discover that the very people who "know it all from experience" are the easiest taken in by agents for "one-minute churns," "tree agents," and the like. This address, however, is not a criticism of other people, and the remark that it is not possible for anyone of us to "know it all" is not a personal one.

To be a practical dairyman; to be "up-to-date;" to be able to turn new ideas to good use; to produce and use the most economical and at the same time the most profitable foods; to have the best of cows, which receive the best of care; to secure the best markets for dairy products, are each of them subjects of wide range, and must all be met and mastered before one is a practical dairyman.

I have always been a lover of sheep, and when the dairy was becoming the leader with me I had little thought that I would ever part with the little flock of sheep; but I had determined to be practical; if the farm was to be a practical dairy farm, everything that was in the way of making the most out of the cows must go. The sheep were such close grazers that the pastures were not in the best shape for the cattle, and somehow cows do not like to graze after many sheep, and the sheep had to go. This has always been considered as doing something that was practical.

Dairying is an art, and I consider that art consists in the ability to see and do. The mischief with us who are engaged in the dairying business is, that we have a great number of what may be called blind farmers amongst us who do not see the end from the beginning.

On the farm and in the dairy there are too many who seem to be contented if they do "as good as the average."

The average anywhere is not a safe place to be. In the store, farm, school, or wherever you may go in the trades or professions, or any line of business, you will find that the average don't pay; that the average is not a success.

A dairy editor sent a man to Iowa to examine and find out what 100 herds of dairy cattle were doing, and he found that over 60 of the herds did not pay for their keep.

The dairy section of the Illinois Agricultural College has a man at work in this state taking herd records of dairy cattle, and his records will show that the average dairy herd does not pay.

In my county there is a condensing factory which has 160 patrons, and of these, 83 make a clear profit while 77 lose or just pay expenses.

No; I say, don't be contented to be an average dairyman. Aim high and exert every effort to make a success of the business. Study the business; if you are working with cows, steers, hogs, horses or grain, be on the lookout for better methods; don't satisfy yourself with the idea that you know it all.

I want to tell you that the dairy business was not a matter of choice with me. It was a case of have to do something or bust. I was not over fond of work, and the farm was one of those poor, hilly ones, and to do something to build it up and at the same time bring in a revenue that could meet current expenses was the all-important issue to be met and settled.

A few cows were purchased and a start made in the dairy. We sell milk by the quantity and prefer the Holsteins; but our market objects to an all-Holstein dairy; so there is some Shorthorn and Jersey blood in the herd.

To secure and keep a dairy herd is one of the practical things that must be learned before success is attained.

Now let us look for a moment at the dairy cow. She should not have a short, broad head nor a thick neck, but the contrary; her head should be long and thin, and broad between the eyes, and her eyes should be bright and clear; she should have a thin neck and large nostrils.

The hips of a dairy cow should be broad. She should have thin thighs, well apart, giving plenty of room for a good udder. The udder should be well developed, and I like to see plenty of veins on the outside of the udder, indicating that the udder is not fleshy.

Some cows will have two milk veins; others will have four or five branching out. The more veins she has the larger they are, and the more crooked the better. The veins do not carry milk to the udder, but return the blood from the udder to the lungs. If large and full, they indicate a good deal of blood passing through, and blood is a producer of milk. Where they enter the body you will find udder holes, called milk wells. The larger and the more there are the better, five or six of them, especially in Holstein cows.

I claim this is the best point to a good cow. When you get the udder, get the milk veins and the milk well, and you have got the dairy cow. These are the only safe and sure signs to go by.

Having a good herd of cows, breed them up to your ideal. Select the breed you want, and buy the best bull or bull calf of your breed that you can afford, or get a neighbor to go into partnership with you in buying a bull.

There is no class of farmers who work together so good as dairymen, and with me this partnership-bull idea works O. K. Raise the heifer calves from your best cows. With a good herd of cows much remains before all the practical work is done.

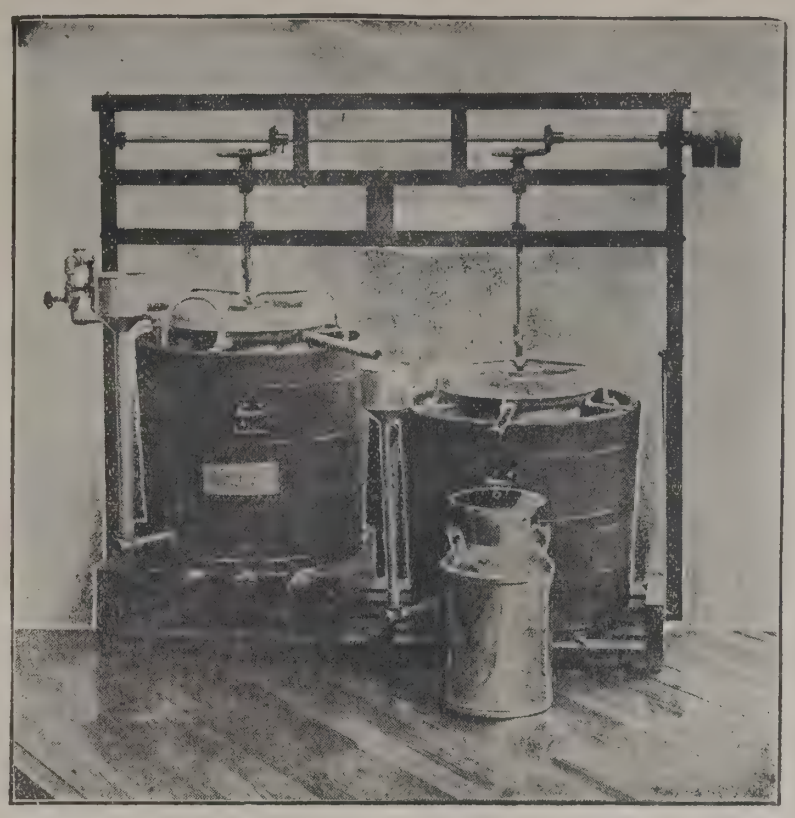
The cows should have the best of care; kind and gentle treatment.

One of our cows has just dropped her second calf. She is a daughter of our best cow and possesses some of her mother's good points, and has been a favorite since she was born. This heifer was a persistent sucker, and so thoroughly was she attached to the sucking habit that at two years old, just after she had dropped her first calf, I noticed one day that while her calf was sucking her, she was sucking another cow. We have never known any other name for her but "Sucker," although she now seems to be completely weaned.

Sucker and I are close friends. She seems to understand that I love her, and there is an unwritten agreement between us that we will be good to each other; and when I throw my arm around her neck and tell her I will be kind to her, and pass a nubbin or apple to her, she seems to understand it all and at the milk pail she reciprocates.

All farmers are not cut out for dairymen, and many are in the business who should not be. I do not consider it practical for any one to mistreat their cows in any way. It is a shame for any one to turn their cows into a stalk field in cold, driz-

NO MAN IS STRONGER THAN HIS STOMACH



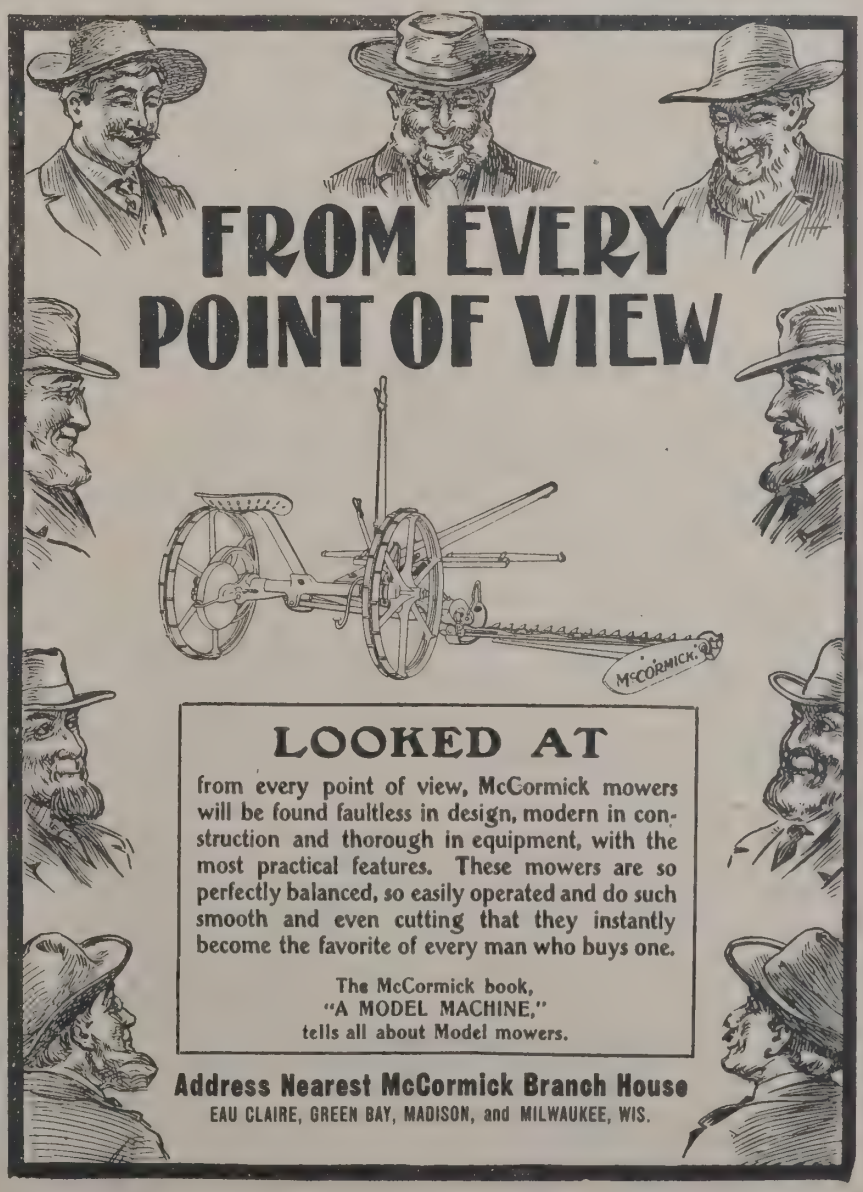
When Sandow poses and the muscles ridge his back and knot his arms, we think we have before us the very secret of strength in those magnificent muscles. But we haven't. Starve Sandow, or, what is practically the same thing, let him be dyspeptic, and his muscle would soon fail. Strength is made from food properly digested and assimilated, and no man is stronger than his stomach, because when the stomach is diseased digestion and assimilation are imperfect.

Dr. Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It enables the perfect digestion and assimilation of food so that the body is nourished into perfect health and strength.

"I had what my physician called indigestion. He gave me medicine for the trouble but it did me no good," writes Mr. W. H. Wells, of Willard, N. C. "I wrote to Dr. Pierce and stated my case. He sent me a descriptive list and hygienic rules. I carried out these as best I could, bought six bottles of his 'Golden Medical Discovery' and commenced taking it. A few days later I noticed a great change. Felt like a new man. Before I began the use of the 'Golden Medical Discovery' I suffered greatly with pain in stomach, my nerves seemed all 'run-down,' I was very thin in flesh, but now can eat heartly and sleep good at night."

Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send twenty-one one-cent stamps for the paper-covered book, or thirty-one stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

A GREAT SUCCESS.



The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.

CANTON, OHIO.

zling weather, or force them to drink ice water all the winter; or, in the summer, for man, boy, or dog, to bring them in from the pasture on the run, or to make them stand around in the cold or mud at any time. These are not practical things for dairymen to do.

Make them as comfortable as possible at all times. It is far more profitable to sell off a part of the herd and take the best of care of what you have left.

The stable should be the best you can afford, and have plenty of light, be ventilated, warm and clean.

As to feed.—As the cows become fresh, feed lightly at first and gradually work them up. As the feed is increased the milk flow increases. As the milk flow increases the appetite increases, and so you work them up to their capacity. They can be held to a full flow of milk only by the best of care and feeding.

A balanced ration is what we should aim to get. I know of no one feed that comes so near being just what is right as oats, cut green and fed in the sheaf, or threshed and ground. I believe in a variety of feeds and think one-third each by weight of ground corn and cob, ground oats and wheat bran is a model feed.

When I eat I want a variety and I must judge the cow's desires by my own.

As to cotton seed meal, gluten meal, oat dust, etc., what I have fed of them does not warrant me to recommend them to be equal to the corn, oats and bran. Others, however, may have obtained better results.

Clover hay I think the best of all hay for cows, if cut at the right time and properly cured. With me, clover is so uncertain that I had to resort to cow peas and soja beans for hay. Either, I think is most as good as clover; but I prefer the Mammoth, or late soja beans. I sowed 20 acres this year (1902), after the rye pasture had headed out, plowing under the rye, and, taking a Superior drill, the beans were sown one-half bushel to the acre in rows 20 inches apart. They were cultivated twice and cut and bound with the grain-binder, October 15. The bundles were stood up in rows six or eight together to dry. November 15 they were hauled into the barn and in as good a condition as I ever had clover or cow peas. They averaged one ton to the acre. They grew about four feet high.

I feed corn fodder in the stable, in the shed and outside. I prefer shredded fodder, as it can always be kept in a dry place. It is poor policy to have to go to the field through the winter, through all kinds of weather, for fodder; and again if the fodder is always nice and dry and clean the cows eat it with a desire for more.

I use a rack for feeding fodder, 16 feet long, 2½ feet high and 4 feet wide. It is bottomless and very cheaply made and easily cleaned. Four posts are used for the corners; the sides are 2-inch pine, and ends 1-inch pine. It is nailed securely together; feed in it till half full of stalks, then turn it over, and it is cleaned. No fodder gets out into the mud, and it is high enough so the hogs cannot get into it.

The dairy business has much against it, compared with other lines of farm work. It is said to be too confining, and that there is so much drudgery; but I notice that in any other business, aside from farming, those who apply themselves the closest to their business are usually the ones who are the most successful, and it is also true that the farmer who sticks close by his herd of cows comes out in the end with a much better improved farm and is more of a practical and financial success than his neighbor who is not a dairyman for fear of the drudgery and the confinement to business he must endure.

Good Silage from Frosted and Dry Corn.

How It was Done.

ED. HOARD'S DAIRYMAN:—I put up a Kalamazoo silo, 16x27, last season, but didn't get it completed so as to fill it before the frost cut the corn. I had to cut and shock the corn in order to save the feed. Well, my power didn't get here in time, so the corn set in the field six weeks before I got to filling. I finished about the fifth day of November, and I have splendid silage. The cows don't leave a bit of it. There was some spoiled at the doors.

The way I filled was this: We had our cutter, which was a No. 3 Belle City with a 35-feet carrier, and run it with a 5 H. P. Weber gasoline engine. The cutter set up on a platform just the heighth of the rack on trucks, then I took a large oil barrel and sat it on a bench by the side of cutter, put a nipple in the barrel with faucet and a nozzle of a sprinkling pot on the end of it; then I used a long rubber hose and connected it on the pipe at the water tank, then set the wind mill to pumping and that kept the barrel full of water. Then when we were cutting we would open the faucet and let water in the barrel. This wet it in good shape. My neighbors all said I was crazy and that it would all spoil and I would have lots of manure to haul out, but, to their surprise, I have got good feed.

DON'T PUT OFF

Seeing your freinds and having them join in for a good club of subscribers.

Cream and Butter Churned.

I weighed up 100 lbs. of cream and it tested 26%, but churned out 33 lbs. of butter. What per cent overrun do you claim that to be? What price per pound for butter fat should I receive to equal 22 cents a pound for butter, and what size pipette should be used for testing cream? My pipette is 17.6 c. c. F. E. O.

Council Bluffs, Iowa.

The above figures indicate an overrun of 27.6 per cent. This is decidedly larger than is obtained in practical work, and we are inclined to think there is a mistake in the testing or figures given. The usual overrun is from 18 to 20 per cent which applied to the above 26 lbs. of fat would show 30 to 31 pounds of butter.

With 18% overrun and butter at 22 cents per pound, the butter fat should be worth 25.96 cents per pound. For testing cream weigh out the cream and take 18 grams for a test. Sometimes ½ of the usual amount (18 grams) 9 grams is taken for a test. A pipette should not be used, as it gives inaccurate results.

How Much Cream.

Will you please tell me how much cream 8 lbs. of good milk contains? R. L. R.

Clarksville, Ga.

Cream varies all the way from 16 per cent fat to 40 per cent fat. As ordinarily sold in cities it is expected to contain about 22 per cent. Milk containing 4 per cent fat is accounted good milk and 8 lbs. of such milk will yield 1½ lbs. of 22 per cent cream.

Weight

Salt that makes weight makes money for the butter maker. DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*," made weight for one creamery at the rate of $8,000 a year in additional profit. The secret is simply this: Whatever weight you add in DIAMOND CRYSTAL SALT, *you obtain in increased weight of butter*. Its pure, dry flakes dissolve completely and become a part of the butter, instead of being washed out, or adhering to the worker rolls, like common, gritty, flinty salt. Our illustrated booklet "Just Salt" is just the thing for dairymen. Free on request.

MACBETH, Pittsburgh.

SOAP MAKING AT HOME

One can of *Banner Lye*—10 cents—will make ten pounds of the best hard soap—better than you can buy.

It takes less time to make soap with

BANNER LYE

than to make bread, and it gives you the purest soap, with absolutely no danger to person or clothes. Not old-style lye, but *Banner Lye*.

It also makes twenty gallons of soft soap.

EASY CLEANING

Cleanliness is a new word since these days of *Banner Lye*. *Banner Lye* washes away the dirt that you see and the dirt that you can't see. This last is most dangerous. It spoils the milk and butter in your bottles and jars, and when hidden in your drains and cellar invites disease.

Banner Lye cleans out all this dirt and the disease germs therein contained. You will be surprised at the difference it makes. It is odorless and colorless.

Get it of your grocer or druggist He can easily get it of his wholesaler, if he hasn't it already.

Write for booklet "*Uses of Banner Lye*"

FARMER BRIGHTON, FAIRFIELD, IOWA.

Do You Want to Own a Gold Mine; to Grow Five Tons of Wheat Bran Per Acre?

(Continued from page 242)

their stock has done very poorly. Some of them have lost money. On Mr. W's farm all animals are thriving wonderfully. He has no end of hay. Lately he sold a carload for $15 a ton, alfalfa hay. What does this mean in the way of profit? Seventy dollars an acre clear net profit, he says. Remember they cut some 350 tons of this hay last year. Mr. Wing tells of paying the miller $600 for wheat bran one year, a while ago, and how he thought, if he could only have that money, instead of paying it out for feed.

He has it now, and far more, and his beef animals, lambs, pigs, etc., just all do just as well. The alfalfa hay is so rich in protein that it is just about as good as wheat bran, ton for ton. Fed with corn, stock scarcely want anything else. This crop is not a new one by any means. In fact, it is almost as old as the hills. They had alfalfa in the time of Christ. Now let us compare it with timothy. Over much of the country timothy is the main hay crop. In Central Ohio, where Mr. Wing lives, the first crop of alfalfa is already to cut about June 1. It starts very early. The first crop will usually be a large one, because there is not likely to be any scarcity of water then. About July 4, the timothy will be ready for the mower, and at the same time there will be the second crop of alfalfa. This may not be so heavy, if weather is dry, but should be cut just the same. In 35 days the third crop will be ready to cut. Meantime the timothy field, which has given but one crop, will usually be all dry and brown. Still again, in latitude of Central Ohio, will the alfalfa need mowing and then some fall pasture after that; four crops instead of one. From two to three times as many tons of hay per acre. The hay contains almost exactly the same amount of carbohydrates and four times as much protein as timothy, ton for ton. Yes I mean it, four times as much. From eight to twelve times as much protein per acre Think of it. And point out anything in this report, or these figures, that is overdrawn or not accurate, if you can. Verily Mr. W. has a gold mine on his farm. You say: "But if I must make my land rich for alfalfa, why bother with it then? I can grow other crops then," Surely; but you have to make land rich once to start alfalfa. Then it will bring you these large crops of such valuable feed for a dozen or more years, perhaps, and when you plow it it will be still richer than before you began growing the crop. It enriches the soil the same as growing the red clover, perhaps still more. Whereas, the other crops would exhaust the fertility soon, unless you put manure back. The alfalfa does not. It can take care of itself when once started. And in most sections will not, say, 5 tons of such hay per acre (5 tons of wheat bran, practically) be worth more than any other crop you can grow? This is no theory. Our Experiment Stations have analyzed the crop and given the figures. Mr. Wing, and some others, have grown the crop and proven the figures correct in actual practice. The object of this article is to awaken an interest in this wonderful crop; to encourage the opening of a gold mine on every reader's farm. Go slow. Put out but little at first. Be sure you get seed that will be hardy with you. One more precaution; don't sow until danger of hard freezing is over, May 1st. in Central Ohio.—T. B. TERRY in *Practical Farmer*.

Pasteurized Milk for City Trade.

THIS RUNT GAINED 360 LBS. IN 160 DAYS. BY EATING "INTERNATIONAL STOCK FOOD."

YOU CANNOT DENY ACTUAL FACTS

A Wonderful Growth of 360 pounds in 160 Days By a "Runt" That Had Been Badly Stunted for Nearly 2 Years and Only Weighed 60 Lbs.

DOW CITY, IOWA.

International Stock Food Co., Minneapolis, Minn.

DEAR SIRS:—I have a runt 2 years old which only weighs 60 pounds. It stands 18 inches high, 42 inches long, and 4 inches wide on widest part of the back. I would like to try "International Stock Food" and see if it will make this runt grow. Four of my neighbors owned it before I got it, and none of them could make it grow. I enclose a photograph which shows this hog is too weak to stand alone, and it will not eat.

F. C. HOWORTH.

DEAR SIRS:—I enclose a photograph of the "runt" taken five months after our commencing to feed "International Stock Food". It weighs 420 lbs. and has developed into a fine looking hog. "International Stock Food" is a remarkable preparation for making hogs grow, and the two photographs I mail are positive proof. Yours truly, F. C. HOWORTH.

We will Pay you $1,000 CASH to Prove that our Testimonials are not Genuine.

"INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and won the Highest Medal at Paris Exposition in 1900 as a high-class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in perfect safety to Horses, Cattle, Sheep, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human System. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these condiments promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by every High Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Forty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Pigs or Hogs grow Amazingly and has the largest sale in the World for curing or preventing Hog Disease. ☞Beware of the many Cheap and Inferior Imitations! No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or Falsifier.

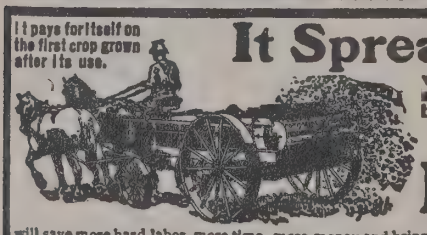
"COME

in the evening or come in the morning. when you're looked for or come without warning"—



You'll always find your Tread Power ready for business. OF WHAT OTHER FARM MOTOR—Wind Steam or Gasoline—can this be said? A PERFECT GOVERNOR ensures absolutely even speed. Send for free catalogue.

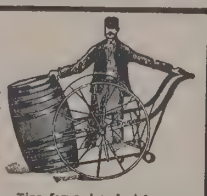
St. Albans Foundry & Implement Co., St. Albans, Vt.

It Spreads Manure,

It pays for itself on the first crop grown after its use.

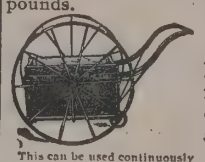
wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED



Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.



KEMP & BURPEE MANUFACTURING CO., BOX 46, SYRACUSE, N. Y.

Official Records of Holstein-Friesian Cows.

From Feb. 10 to March 14, 1903.

This class of records are made under the supervision of agricultural colleges and state experiment stations. In every case a representative of such an institution, paid by the institution, oversees the entire work. The samples of milk are tested by him in duplicate and a composite sample is forwarded by him to the station or college to be tested there. In cases of phenomenal production retests are also made during which the cows are constantly watched that by no possibility the contents of their udders can be affected by the injection of milk or fat.

During this period reports of tests of sixty cows have been received,—the seven-day records being sixty, the thirty-day records ten, one for fourteen days, one for twenty-four days, one for twenty-eight days and one for sixty days as follows:

Sadie Vale Concordia 32259, age 10 years—Record for twenty-eight days, days after calving 5; milk 2,565.6 lbs., butter fat 92.327 lbs., best seven consecutive days, days after calving, 14, milk 694.3 lbs., butter fat 24.508 lbs. This cow was retested twice,—the first time showing a product of less than a half ounce of the average of the previous seven days, the second a product of eight one-hundredths of an ounce less than the average of the best seven days. This record is undoubtedly the largest strictly official record ever reported. Owners, Mc Adam & Heyne, Deansbaro, N. Y.

May Hartog Pauline DeKol 45124, age 4 years, 11 months. Record for thirty days, days after calving 14, milk 2,552.5 lbs., butter fat 89.637 lbs., best seven consecutive days, days after calving 20, milk 633.2 lbs., butter fat 23.417 lbs. Food consumed: ensilage 56 lbs., hay 99 lbs., turnips 315 lbs., hominy chop 51.5 lbs., gluten feed 48 lbs., oats 24.5 lbs., bran 45.3 lbs. and oil meal 22.7 lbs. Owner, H. D. Roe, Augusta, N. J.

Armyn's An 4th, 50398—4 years. Record for 30 days, days after calving 8; milk 2,311 lbs., butter fat 71.780 lbs., best seven consecutive days, days after calving 27, milk 450.3 lbs, butter fat 17.822 lbs. Owner H. D. Roe, Augusta, N. J.

Lady Oak Fern-44126 5 years 11 months. Record for thirty days, days after calving 13, milk 1,875.4 lbs., butter fat 70.311 lbs., best seven consecutive days, days after calving 27, milk 450.3 lbs., butter fat 17.416 lbs. Owner W. H. Jones, Watertown, Wis.

QUALITY ELMCO MARK

ELMCO BRAN

—ANALYSIS:—

Moisture 10.03 Crude Protein 16.71 Ether Extract 4.80

F. W. WOLL, Chemist, University of Wis., Agricultural Experiment Sta.

Is guaranteed pure and free from ground screenings or any adulteration. In feeding **ELMCO BRAN** you obtain always satisfactory results. The milk is rich, and butter made from the cream of such milk is not bitter. This is untrue of Bran mixed with ground screenings. It costs a trifle more to get pure Bran, but it pays better in the long run. If you buy **ELMCO BRAN** you buy the best.

Rosa Bonheur 5th' Colantha Lad.

Ed. Hoard's Dairyman:—The breeding of Rosa Bonheur 5th's Colantha Lad No. 28025, here given tells its own story. His dam, Rosa Bonheur 5th has an official record as follows:

Days.	*Lbs. milk.*	*Lbs. butter 80% fat.*
1	106.75	4.025
7	726.25	25.5875
30	2989.50	102.7
314	17043.45	586 89

making an average per day for the 314 days of 54¼ lbs. of milk and 1.869 lbs. 80% butter, being 193 days in calf at the close of the above record. His sire's dam, Colantha 4th took first prize in Association's 7-day butter test of 1899 and 1900. She also took first prize in food test same year with 7-day test of 24 lbs. 7.8 oz. 80% butter with a net profit of $4.338; producing butter at 5.3 cents per lb. His sire's sire, Paul Mutual De Kol 18726, is a son of the great bull Paul De Kol 14634 and the cow Mutual Friend 2nd, whose official test is 25.75 lbs. 80% butter. Paul De Kol 14634 was sired by De Kol 2nd's Prince 2767, and his dam was the great Pauline Paul, the dam of De Kol 2nd's Prince. De Kol 2nd's official 80% butter record is 26 lbs. 9.21 oz. This bull's get are large and growthy, showing great dairy form with strong and vigorous constitution. His daughters give promise of making extra large producers and we are in hopes that they will surpass their ancestors and think they have very good chances for so doing with present prospects. F. G. Johnston & Co.

Columbus, O.

Records in the Dairy.

Ed. Hoard's Dairyman:—As to the necessity of recording various items in connection with the dairy, too much cannot be said; more especially on the most important point of all, viz, the daily record of each individual cow that is kept in the herd; this, I am sorry to say is very often neglected altogether. In paying the various dairy farms a visit, one finds very few indeed, where the farmer can relate to you the actual records of each cow, which he has on paper. Generally speaking, nearly every dairyman can, of course, give a more or less satisfactory reply to any question as to the yields and performances of his cattle, but on the other hand, there is hardly one in a hundred who can produce his books to prove his statements. The great majority of dairymen in this country are carrying on their business without the actual knowledge of the profit they are making or losing, as the case may be, by each cow they have in their herds. No doubt they have a pretty fair idea of how they are progressing from year to year, but from the particular animals they are making most profit or loss, they know but very little, and certainly not half so much as they should know. If one animal is deceptive, it clearly proves that a number is still far more puzzling.

There is no man that can actually tell what a cow can do, or is doing, until he tests her yield on the scales daily; but then again, a record of her milk yield is of great value in other ways besides the immediate fact of knowing whether she is profitable or unprofitable, more particularly in showing whether her offspring are worth keeping.

The advantages of keeping records are numerous; and to mention a few before I proceede further, may not be altogether out of place. In the first place, when a dairyman looks over his records at the end of each week, any difference in the yield of any cow from one day to another, will at once be noticed. Perhaps in some instances, a very large decrease is noticed; this will be the means of causing the farmer to investigate the matter. Probably it may prove to be bad milking, or some sickness of one kind or another. This could, under the record system, be immediately looked to, and probably rectified. Then again, increase or decrease of the yield may be caused, owing to the change on different pastures, so that in this case it will be easily seen by the records, which feeds give the best yield. Careless milking is also a point worthy of consideration, for this not only ruins the pocket, but also ruins the cows.

The owner should always supervise this branch of the business, and the daily weighing of the milk is a splendid check for careless milkers. When any shortage occurs, it can immediately be looked into, and most probably stopped before any great damage is done. Cows are spoilt far more than they should be in regard to their milk producing powers by careless milking, thus allowing their udders to go out not thoroughly dried; irregularity in the time of milking and feeding also helps to spoil cows. In a great measure, daily records help to counterbalance these bad effects.

Of course, taking records similar to that taken in a show yard would be quite impossible on a large dairy farm, but the idea should be followed as closely as possible in regard to quantity and weight of milk produced each day. Of course it is not at all necessary to test a cow's milk every day; once every three months is ample for all practical purposes. A very good plan is to weigh each cow's milk after she has been milked. Some I may state only measure it, but this plan is not altogether accurate, owing to the head of froth that often collects on the top, more especially with fast milkers; hence, weighing I think is the better plan of the two. Some use the ordinary weighing machine, one bucket being kept always on the machine, so that there is no bother in deducting the weight every time.

As each milker finishes the animal, the contents of his bucket is emptied into the one on the scales, remembering each time to deduct the weight of the bucket; the record is then booked. There are other machines that are a great improvement on the ordinary scales. These can be hung up in any convenient place, or even stood on the floor by using a stand so that the machine can be attached. I have frequently heard dairyman say that keeping records is a process involving too much trouble and labor. However, if those who condemned the process were only to try it, I think they would altogether alter their opinions. Once a man gets into the way of keeping records he will never go back into the old, slipshod system again. There is not the slightest doubt but that this system is far and away the best, and every progressive dairyman should adopt it. It not only helps one in the fact of knowing the actual profit he is making, but it also helps him in breeding. It is not a fair test of an animal's production to judge her when she is fresh, or when the pastures are at their best. However, weighing the milk for a whole twelve months, clearly shows the performance of each animal, and the keep of a good animal costs no more than the keep of a poor one.

Then again, in working up a herd of good milkers, the actual results of each cow must always be retained. For in the majority of cases, like produces like; hence, when a mother is a proved milker, the heifers from that cow invariably turn out good milkers also.

By keeping these actual results, the unprofitable animals can always be culled, thus leaving those who are sure to produce a profit. It is not altogether an easy matter to fix a standard. This greatly depends on certain circumstances, and in some cases it may prove higher than in others, but I think any cow yielding less than from 400 to 500 gallons yearly is not good enough for a dairyman to keep. Although this may be the standard fixed, yet I fear there are many herds, in this country at any rate, that are yielding very much less, but by careful management a vast difference in the earnings of the dairymen would surely take place.

TILED WALLS AND FLOORS FOR FACTORIES.

The question of how to combine permanency with thorough cleanliness has been a great source of trouble to many of our factory managers, and the problem has been a very great puzzle to many of those connected in this line of business. It has also been a great necessity, too, for the want of some material for the lining of the walls of factories, to procure cleanliness in the walls, as well as the floors. It is ever a well known fact that wooden floors and walls soon become so thoroughly saturated with moisture that no matter how often they may be cleaned and scrubbed, the effects of this cleansing does not reach further than the surface. After the lapse of a few years the soddened timber not only commences to rot, but also provides a natural home where millions of germs find a place to collect, and to entirely remove them is quite an impossibility. This has been the experience in connection with wooden floors in the leading dairying centres of this country.

It is a very evident fact that the peculiar, stale smelling atmosphere, always impossible to remove from decaying timber that is full of moisture, furnishes most objectionable surroundings for such delicate products as milk, cream and butter. If the truth were only really known it would be seen that a large percentage of the troubles that beset factories and creameries in the conversion of the raw material into butter, originates from the germs that lurk in the decaying walls and floors that exist in a great many of our factories and creameries.

One has only to look at the filth and dirt that is discovered when the floor of an old factory is being taken up to be replaced by a new one. What is really needed is a remedy for this state of affairs, and this can certainly be best provided by resorting to the use of tiles for floor and for the linings of the walls. There is no need, I think, of saying that the tiles would prove both germ proof and water proof. But tiles like all other material, vary very much in quality, therefore it is absolutely necessary to be very careful in the selection of tiles for butter factory use, otherwise if any inferior article is used, they are sure to absorb the moisture almost as readily as a sponge and prove just as unsatisfactory and undesirable as wood. I know of a few factories that have made use of cheap tiles, half an inch thick, but the result was anything but satisfactory. However, there are some firms that are making a speciality of the manufacture of tiles, most suitable for the walls and floors of butter factories. Flooring tiles should be an inch thick, and being thoroughly vitrified, are quite proof against moisture. When the wall tiles are nicely finished their surface gives them an attractive appearance. Australia.

Ill-advised and Antiquated Rules for City Milk Supply by Health Boards.

Ed. Hoard's Dairyman:—Before me is an "Application for Inspection of Milk" by the "Inspector of Food and Milk," for the Health Board of a certain small city, the name of which, for obvious reasons, is not given. It is a great pity that matters of such importance are left in the hands of interested parties (as in this case a veterinarian) who either don't know or don't want to know anything about late progressive improvements adopted for milk supply. I should prefer these rules printed in full in Hoard's Dairyman, but as space is scarce I shall pick a few, especially objectionable points.

Thus, no milk shall be delivered "from cows within 60 days before calving;" "fed partially on ensilage;" "in summer, milk before 5 p. m," "milk which in any way differs from fresh, etc.," "from cows not inspected by Board of Health Inspector," "no milk drawn from the cow more than 15 hours, etc."

Of course the "Application" also contains all those well known rules adopted with slight variations by the various "milk commissions" for the production of so-called certified milk, which are all very good as far as they go, but never can become popular and generally adopted by milk producers, unless they also can secure some guaranty as to receiving extra pay for extra care and expense, which they never will.

I shall try to show how unreasonable and impracticable some of these rules are: Why shall "no milk from cows sixty days before calving" not be used for human food? While an exclusive diet on milk from cows thus late in lactation would not be desirable, it is ridiculous that milk from long milking cows as Jerseys and Guernseys and others should not be used for food, provided it is mixed with the milk from the whole herd.

By condemning all feeding of ensilage, the author surely proves how little he is posted as to what is approved of by such well known authorities on feeding for special sanitary milk as H. B. Gurler, the Walker-Gordon Laboratories, and all the milk commissions for certified milk supply, which now all heartily recommend moderate feeding of silage.

The last mentioned four rules plainly show that the author is trying to make such restrictions in the manner of supplying milk, which would make it impossible for any milk producer located at a further distance to sell any milk in said town. Personally, I most emphatically believe that the dairymen of the immediate neighborhood of any town always should be encouraged in every fair and practical manner to supply all milk needed for family use in said town; but I do not consider it wise for a health board to

adopt any measures by which it would be practically impossible for any milk producer to ship milk in by railroad. Regulations of such kind would make many of the near-by dairymen feel safe against all outside competition, and would rather tend to encourage carelessness than otherwise; while the chance for some outside competition always must act as an incentive to the near by milk producers to do their very best to produce the cleanest and purest milk possible.

Rather than such preventive measures against "milking in summer before 5 p. m., or drawn from the cows more than 15 hours," the health board should make it a law that no milk should be peddled about town at a temperature above 50°. That "only milk from cows inspected by health board inspector" should be sold, sounds very nice, but would also cut off railroad shipments, and a really thorough and effective inspection of nearby herds and dairies can never be carried out with the average available funds.

But one rule seems to be especially aimed against the sale of all pasteurized milk based upon an antiquated prejudice, which looks so much more curious, as it is a very common custom to-day among physicians to advise mothers to *boil* the milk for the baby, unless it comes from an absolutely safe source; proper pasteurization hardly changes the natural character of the milk, except as far as it kills all possible disease germs as well as such which cause souring; while boiling certainly may be quite objectionable. Still an ordinance preventing the sale of "any milk in any way different from fresh," would prevent the distribution of even the purest, cleanest milk, which had been heated in any manner. All efforts to supply pure, raw milk for all people, even the poorest, at reasonable prices, have failed, and pasteurization has already been proven in many cities as the only practical method by which the all important problem may be solved.

When may we hope for such ordinances by health boards, which will encourage proper pasteurization? It must happen soon; which health board will be the one which dares to be progressive and consider the welfare of all the people? J. MOLDENHAWER.

Canton, Ohio.

Notes from New York.

Farm Values Compared.

ED. HOARD'S DAIRYMAN:—By some of the writers in HOARD'S DAIRYMAN, there is this same question taken up and it has occurred to me that the difference in value of farm lands in different sections where different staple crops are raised, is accounted for by various reasons. Good, strong producing land is worth, or should be worth, in one section of old settled country, as much as it is in another equally thickly settled section, regardless of the staple crop raised. Preference for one mode of farming over that of another mode, carried on extensively in one section more than it is in another, is largely to blame for the difference in price.

There is no reason that equally as good land in the dairy sections of Wisconsin and Illinois, should not be worth as much per acre as the land situated in the wheat or corn belt of Iowa and Minnesota. When such a state of affairs exist, that the people or a large majority of them want to take up the raising of any one staple crop, then a boom in farm values in the most favored sections where that crop can be raised, is the result, until the business is overdone and some other product that has been neglected, is paying better returns and a boom is started in that direction. So the thing sways back and forth as a pendulum.

I do not see why there is not as much to be made from a given area devoted to dairying, with milk selling around $1.04 per hundred, as it would to be devoted to raising any cereal crop. It all depends on the men. Some men make failures in raising corn, others in raising wheat, and others in keeping cows. Failure stares a man in the face in any line of business unless business principles are studied and put in operation. Many prefer to raise wheat, because they can cover a larger area of land, have a bigger farm, which makes them feel bigger.

They can do with less hired labor on the same area than as though it was devoted to dairying. The work is not so confining, does not require the attention each day of the year as the dairy does, there is a long interval between the sowing and reaping time; but with the well conducted dairy, with cows capable of making a nice profit over and above their cost of keeping, in short such dairy Holsteins as we read of, I believe the man, and the farm devoted to dairying will win first money at the end of the year or perish. Dairymen, if your business just now does not seem to give you the returns or look quite so promising as does the wheat growing, or your lands do not advance in price quite so rapidly as theirs, don't get discouraged. All you have got to do is to wait. It will be your turn next; wait, and while waiting get cheaper rations, better cows, and machinery to take the place of high priced labor. The dairy business has many advantages over most any other, but the most permanent one is this, quick returns. It allows those who are engaged in it to pay as they go.

Now again, where the land is all land, what is the reason that a cow cannot be kept on the products grown from 1½ acres—well, we will make it two acres. Certainly that is area enough and she ought to bring in to the dairyman $50 to $100 according to the man, her owner. Where is there land devoted to wheat or corn in the west, that will bring 25 to 50 dollars per acre, each year? We do not wish to challenge the corn raisers to an extended argument over the advantages of that business *vs.* that of dairying, but we would like to know why old Jersey during the wet or dry, the hot or cold, no matter what, with the silo full, cannot be depended upon to feed and clothe the little fellows crowded around the farmer's table. The Chicago wheat pit does not create uneasiness in his mind.

Stick to dairying, to the best dairy literature, to HOARD'S DAIRYMAN, and no matter whether your acres will bring as many dollars as those of some other section, as long as your income is as large as the other fellow's. You don't care to speculate or change your business and dispose of those highly prized cattle, rip up your fields and draw them to market load by load.

Thirty years ago wheat raising in our section was also the staple crop and the money maker, as it was worth $2.50 per bu. but gradually the yield and the price changed the attention of the farmers towards something else and today one scarcely can find a field of wheat. Again I say, stick to dairying. Put your dairy on a paying basis, make your home grown products when sold to your cows bring you a profit of 25 per cent at least, and have the manure thrown in.

Mr. B. H. M. of Vermont, on page 226 in the DAIRYMAN, says, "am getting $1.50 for each $1.00 in feed. My herd is improving, so my courage is good." He is contented, prosperous, and no matter what his acres are worth so long as his profits and income is assured. Take courage, gather in the inspiration of such men as B. H. M. Follow their examples and soon you won't care about the price of land in the wheat, corn or sugar beet sections.

Now as for me—Why, I wouldn't take the best farm in the state of Iowa as a gift and be obliged to make it my home. The old Empire State is good enough for me. I presume there are any quantity of men in Iowa who think the same of New York. Accept the conditions which surround you and make the best of them, is my idea. JAS. M. PLATO.

New York.

Creamery on Flat Land.

In Such Cases the Drainage Problem is a Very Serious One—Would Pay to Build New on Higher Ground.

The *Farmer*, St. Paul, prints a letter and reply to same by A. W. Trow as follows:

O. A. Ulland, Lansing, Minn., writes: "The question of successful drainage presses us. This country is quite level, our creamery has run eleven years and we have got along in a way with cess-pools, open ditches along the road and such like, but now the ground seems of late to be so filled up with the foul stuff that it will not disappear, and at certain times in summer it is almost unbearable for nearby residents. Sometime ago we had a slush well drilled and led the refuse into that, but that soon soiled the well in the creamery and had to be discarded. I have heard that creameries have been ordered to cement their cess-pools. Is there a way to destroy the foul stuff cheaply and successfully with chemicals? Or how do those people do it if there is any such way?"

ANSWER.—Our advice would be to move onto higher ground. The results of bad drainage will bring losses to an extent that will in time pay for a new creamery. Many devices for surface drainage have been recommended for flat land, but we know of none that have stood the test. If a covered cess-pool is used it must be in a locality where there are no wells, and we would recommend that it be at least twenty rods from the creamery well. A large covered cess-pool in most soils will not last to exceed one year.

We tried the cistern with a skim station, which did very nicely, and had no serious objection, excepting the expense of hauling away the slop. A cistern for holding the slop may be built by cementing onto the clay, or by using brick with the cement on sandy soils. We doubt if this kind of a cistern would be practicable for a creamery, on account of the great expense that might be incurred in hauling away the slop. This expense might be as much as the interest on the cost of a new creamery. Lime is the best cheap disinfectant that we know of but it would require the continuous application of a very large quantity to disinfect or deodorize the large amount of slop that comes from a creamery.

This difficulty, and the trouble that scores of other creameries are having as a result of building on low, flat ground, should be a warning to those who are about to build new creameries.

Good drainage is the first essential to the making of good butter and the creamery that stands on such ground is well nigh worthless for creamery purposes.

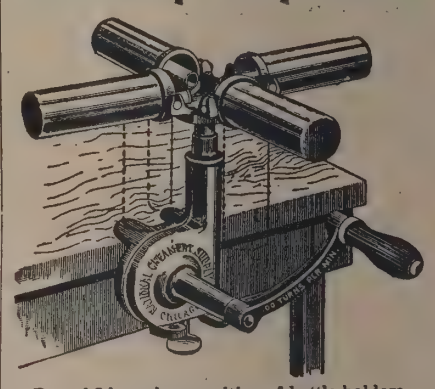
Small Corn Huskers Wanted.

ED. HOARD'S DAIRYMAN:—I am going to add to your efforts in behalf of a good many small farmers, myself included, a request for information about a corn husker, which will husk five or ten acres of corn, either by hand power or three-horse power engine. I wrote to the Harvester people who replied that it took an eight horse power engine and numerous dollars to boot. This is nonsense—ten acres of corn will not carry the interest. But the time spent comes in the very season most valuable to the small New England farmer far full work.

Can you start up some information?

Conn. FANNY M. SMITH.

We suppose it is with the manufacturers of corn huskers, as it was a few years ago with the manufacturers of cream separators, a seeming unwillingness to respond to the wants of the small farmer. The separator people, however, were wise enough to see their error and now the farm separator is no small part of their business. It will be the same with these manufacturers of corn huskers. Sooner or later, they must make machines adapted for use of people who raise but a few acres of corn, and those men who first respond to this demand with a successful machine will not want for orders.



The Life of a Watch 25

JAS. BOSS Stiffened GOLD Watch Cases

are guaranteed for 25 years. Few solid gold cases will last that long without wearing too thin, to safely protect the works. If you want a watch case for protection, durability and beauty, get the Boss with the keystone trade-mark stamped inside. Send for booklet.

THE KEYSTONE WATCH CASE CO., Philadelphia.

NATIONAL Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each 4 50
No. 4,—4 bottle, complete for testing cream and milk, each 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

We are the great Dairy Supply House of the West. We carry an immense stock of all kinds of Butter and Cheese Making Apparatus and Supplies. Write for catalogues and circulars.

National Creamery Supply Co.,
450-458 Illinois St.,
CHICAGO, U. S. A.

We wish to announce that we are now operating our new factory at Irwin, Pa. Capacity—1000 cans daily, which should enable us to fill all orders promptly.

Every can sold on a guarantee. Write for Circular H.

CREAMERYMEN, DAIRYMEN and MILK DEALERS

Can be Promptly Furnished with anything they want at reasonable prices, if they will write me. My CHILDS' PATENT MILK BOTTLE FILLER is the best on the market. Send for free catalog.

J. S. BIESECKER,
59 Murray St., New York City.

Some Thoughts Suggested by Reading the April 10th Number of Hoard's Dairyman.

ED. HOARD'S DAIRYMAN:—While reading the paper of the above date I looked up and saw hanging on my wall pictures of Uncle Jerry Rusk and W. D. Hoard, two men who have been governors of Wisconsin, and two men who were as well posted in the needs and as much interested in the success of the yeomanry of our state as any governors we ever had.

On page 194 Old Roadmaster visits Washington, and after nearly six months' sojourn there I am prepared to endorse all he says and add that with the 600 or 700 acres of groves, parks, street trees, flower gardens and lawns, it is one of the most beautiful places I ever saw.

Page 195 shows that you have a Cherman student who has not been reading your baper in vain. I will not try to repeat his name, for to me it is as horrible as the Holstein cow he speaks of. Will only say that when Jacob's dodder fell in love with the Guernseys she did not miss it much, and if Peter falls in love with Miss Chenny he won't miss it eider.

Page 198 contains several items. I can only speak of a few. First, Prof. Carlyle's statement about heifers. Extended observation has taught me that it would be as impossible to feed every heifer so she would make 300 lbs. of butter per year, as it would be to feed and bring up every boy born in the state so good that we would not need jails or reform schools; the poor and bad ones ye will always have with you.

If any reader passed over the item from the Oklahoma Station carelessly please look up your files and re-read it, for it applies to the family, as well as to the herd. For I candidly believe the better we know or acquaint ourselves with what we eat and feed, the better results we will have in health and profits. When I read, or am reliably informed, that food and drink for sale to the family is prepared inside of closed doors, and only those who know about the ingredients are allowed there, and that hundreds of tons of corn cobs are bought annually for some purpose, and that feeds are mixed and sold to farmers who are ignorant of the ingredients, we must expect that starvation, swindling, ill health, or some other bad result, will follow.

I desire to back up the statement said to be made by Schlosser Bros., of Indiana, that it is possible to make dairying more profitable. About twenty years ago in the town where I live, as they say, farmers kept from 3 to 7 or 8 cows, and butter was sold at the stores, and not a copy of HOARD'S DAIRYMAN was taken in the town. In 1885 farmers' institutes started, and some of the farmers began taking the DAIRYMAN. Some of the seed sown fell in favorable places and produced fruit and awakened inquiry. A creamery was built which made a few hundred lbs. of butter the first year. Cows began to increase so that now there are from 5 to 50 on all the farms, and last year there was over $170,000 paid for cream, which made over 800,000 lbs. of butter in this creamery. This ought to convince the most skeptical that these men are right in their conclusions.

I cannot take time or space to comment on all I read in this issue, but do want to say to Vermonter on page 199 that he is right in asking questions. He is also right in buying a Babcock test and weighing his milk, but on the bull business he is wrong. I tried for ten years to wipe out a $3,000 mortgage with scrub cows and a grade bull. The result was I paid the interest, but the mortgage increased to $3,250. Then I tried a full blood bull and heifer and by keeping my females and buying a first class full blood bull as often as a change was necessary, I succeeded in wiping out the mortgage in the next ten years. To wipe out your mortgage you need the best of help and a first-class animal is better than a grade, though the expense is a little more. I know whereof I speak.

I also want to answer the inquires from North Carolina. I can do it with more freedom than a man working for different breeds can, as I have tried four dairy breeds and now have none to sell as I sold out. I will say to him as the veteran dairymen, Sam Houston, said to me in answer to that same question. Start with the best common cows you can find and buy, always selecting those of the dairy type, then buy the best bred Guernsey bull you can and be sure he descended from a good producing dam, then follow in one line, changing bulls when necessary, and instead of buying calves or yearlings, buy matured sires when you can and you will in a few years be well satisfied with your results. Try it.

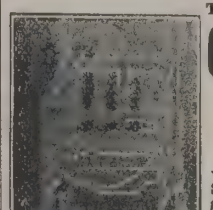
The short article from the Energetic Pencil Pusher of Missouri, on page 206, shows what a plucky farmer can do with butter and berries. That sounds different from an item I read years ago of a Missouri farmer after the war. When his guest asked for cream in his coffee, he said he had 75 cows but it was too much trouble to milk them. Would say to the Arizona dairyman you need nothing better than a brick inside wall for your silo, then 2 coats of cement will make it tight as a fruit jar. I have stone on the out side and brick inside.

I have been to Mr. Gurler's and seen how his work is done; and I always like to read his articles published unselfishly to benefit others, and I often wish I could take some dual-purpose fellows we have here (who think these details are all useless, who won't read dairy literature, who think they are a good dairymen, and think a cow is a cow, and that a man is a fool who will pay $100 for a bull, etc., etc.) to his place, or others I could mention, and let them see the results of good work in the dairy.

I read in "reading notices" that Mr. A. Parks, of Pickets, Wis., is offering the bull, Salem's King A. G. C. C. No. 5362 for sale. This bull I bred, his dam was Queen Vashti No. 6051. She was the Dam of Yeksa Queen 6631, who made 599 lbs. of butter in 12 months. She was also the dam of Queen Deette 9794, who made 18.90 lbs. butter in 7 days, official test, and was the first cow to go into the Guernsey advanced register, on a 7 days' test. This bull, Salem's King, if he has been carefully used should be a good one to improve a herd of cows, for some man, for he is well bred in butter lines.

I close with reading Mr. Jensen's earnest article, page 213, wherein he asks does it pay to make second grade butter. I say, yes, sometimes, when you can not do better; circumstances control it. Our creamery has ten teams gathering cream; we have had for four weeks the worst roads ever known here, haulers sometimes were stuck with four good horses; some farms had to be missed for four, five or perhaps six days, and as a result many cans were consigned by the nose of the butter maker to the stink vat from which they are made up and sold without brand on the market on their merits—the price averaging through the year two cents less than the regular price. The average price paid for butter fat here last year was 24 5-12 cents; creamery butter is selling here now April 13th at 25 cents per pound, and good dairy butter at 20 cents. Our cream haulers, all put up ice, which they carry with them in summer to keep cream cool; they gather three times a week. Farmers all put up ice too, which brings cream in good shape.

A. J. PHILIPS.



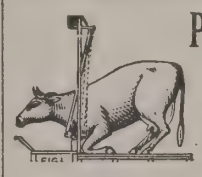
West Salem, Wis.

There's a right chimney for every lamp, and my name is on it.

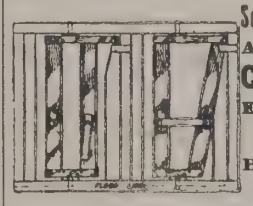
MACBETH.

If you'll send your address, I'll send you the Index to Lamps and their Chimneys, to tell you what number to get for your lamp.

MACBETH, Pittsburgh.

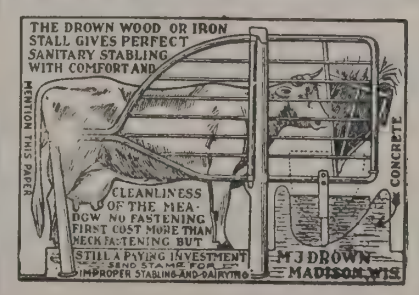


THE NEW PATENT
Cow Stall
AND FEED TROUGH.

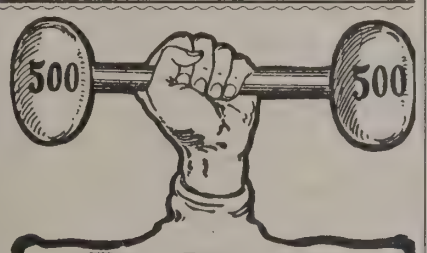


This is the only Cow Stal with a centering hinge Stalls all fold back to manger as the cows go out, the barn. When ready for use, by starting one stall at come into position. No pos at the gutter. Send for circulars. R. A McLERY & CO., Palmyra, Wis.

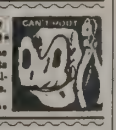
The BEST Cattle Fastening.
SMITH'S Self-Adjusting Swing Stanchion. The only PRACTICAL swing stanchion invented. Thousands in use. Illustrated Circular free. GLENORA MFG. CO., Glenora, Yates Co., N. Y.
Infringements will be prosecuted.



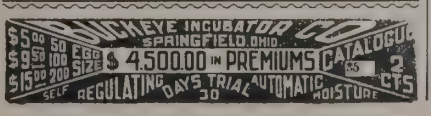
Prescott's Swinging Swivel tanchion
Keeps Cows Clean.
Swings forward while getting up or lying down. Locks back while standing Full particulars free.
E. PRESCOTT,
Beverly St., Boston, Mass.

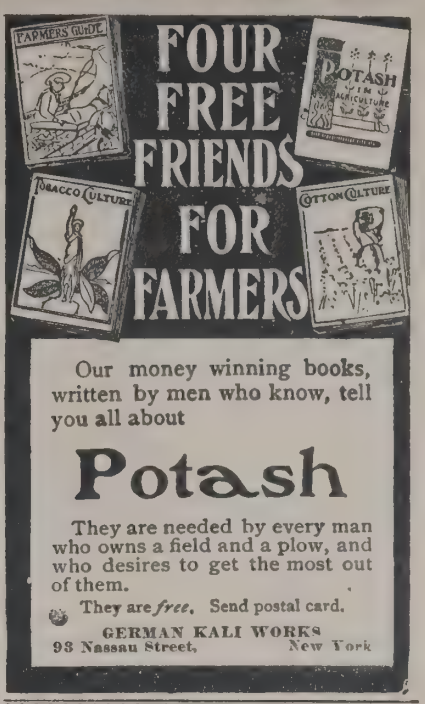


Scott's Perfect Swinging And Self Closing
Cow Stanchion
Each cow shuts her self in place.
CIRCULARS FREE.
B. C. SCOTT,
211 Beach Street,
Bridgeport, Conn.



WILDER'S PATENT SWING STANCHIONS
Chain or Pin Fastened.
Are self adjusting and noiseless. Fasten themselves open when animal is out; swing freely when latch is closed; opened and closed without removing mittens or gloves; keep cattle clean with most freedom of motion; blind bolted and cannot get loose in joints; made of best selected hardwood and furnished with chains or pins as desired.
Safest, Strongest, Most Convenient fastening made. Cheapest to put in and save room in barn. Send for Stanchion Catalog to
J. K. WILDER & SONS, BOX 11, MONROE, MICHIGAN.





The Strength
of the coffee you buy adds to its value in the cup.
Lion Coffee
comes to you fresh and of full strength, always in sealed, air-tight packages. Bulk coffees lose their strength, deteriorate in flavor, and also gather dirt.
Uniformity, freshness and full strength are insured to users of Lion Coffee.

NO HUMBUG. Three in One.
Swine V, Stock Marker and Calf Dehorner. Stops swine from rooting. Makes 48 different ear marks. Extracts Horns. Price $1.50. Send $1 for trial. If it suits, send balance. Pat'd May 6, 1902. Hog and Calf Holder only 75c.
FARMER BRIGHTON, FAIRFIELD, IOWA.

Butter is Exposed
to many contaminating odors in commission houses and shops before it reaches the consumer. If the creameryman will wrap every pound print separately in
Pioneer Brand
Parchment Paper
he will shut out all foreign odors and taints and preserve its purity, sweetness and flavor. He will be safeguarding his brand in the best butter protector known. **Pioneer Parchment** is a **pure vegetable** parchment—not an imitation. It is tougher and stronger when wet than when dry. It imparts no taste or smell to the butter for the very good reason that it does not have either. You ought to have your name or brand printed on every package you sell. If you really make good butter, that is your most effective means of getting a reputation for it. We know how to do that printing so that it will not rub off or discolor the butter—print what you want. Our free samples of parchment paper are most convincing of their great worth to the butter maker. Write and ask for them. And our free book, "Better Butter" will interest and instruct you. Ask for it too.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

A SUCCESSFUL SALE.

Mr. C. F. Hunt's sale of Holstein-Friesian cattle at Syracuse, N. Y., April 22nd, was very successful, particularly when the inclement weather is considered. The stock, as offered, was not in show-ring form but in good working condition, Prices ranged from $30 for some of the bull calves, to $500 for a heifer calf four months old. Stevens Bros. of Lacona, N. Y., bought the two-year-old bull, Beryl Wayne's Son, for $455. Mr. L. J. Fitsgerald of Courtland, N. Y., bought an extra good individual, Aaggie De Kol Wayne, for $300.

Good stock well advertised bring good prices.

KANSAS IDEAS.

W. F. Jensen, of the Continental Creamery Co., Topeka, Kansas, tells the New York *Produce Review* of the butter prospects in Kansas the coming year. He estimates the increased output to be 30 to 40 per cent. The high prices of beef have fallen off 50 per cent, while the cow is doing business at the old stand the same as ever. His company has sold 2,500 hand separators since Jan. 1st; have put in 48 new receiving stations, and the new central churning station will turn out 60,000 pounds of butter a day.

Their system is this: The cream is taken from farmers at the receiving stations where it is weighed, tested, pasteurized and cooled down. It is then shipped in refrigerator express cars to the central station. Cream is thus received from stations 300 to 320 miles distant.

Mr. Jensen is very decided in the statement that with hand separator cream it must be delivered every day in summer and every other day in winter. He is of the opinion that the use of the hand separator will create a desire in farmers to make better posted dairymen of themselves.

A COMPARISON OF STATES AND COWS.

In a communication to the *Produce Review*, President Newman, of the Illinois Dairymen's Association, cites the following facts from the late United States census, showing the number of cows and the value of their yearly product in several states:

"The number of farms reporting dairy cattle in Illinois, 230,625; number of cows, 1,007,664; value of their yearly product, $29,638,619, or about $29 per cow.

Illinois cows average only 454 gallons of milk, or 3,850 lbs. for each cow per year.

I find that the ideal cow gives 2,754 lbs. of milk in 30 days.

I find Kansas cows averaged less than $20 per cow, also Nebraska and South Dakota."

Mr. Newman then appends the following census statistics:

STATE.	Cows.	Products.	Av. per cow.
Iowa	1,423,648	27,516,870	$19.30
Minnesota	753,632	16,623,460	23.00
Vermont	270,194	9,321,389	36.00
New York	1,501,600	55,474,155	37.00
New Hampshire	115,036	71,172	55.00

I find in our own state the three principal counties are:

COUNTY.	Farms.	Cows.	Value Products.	Average per cow.
McHenry	2,598	52,593	$2,243,974	$43.00
Cook	4,491	35,030	1,585,252	44.00
Kane	2,163	42,744	2,177,289	50.00

It is generally accepted that it costs $30 and over to feed an ordinary cow one year.

Note the above figures and see what application they have to the everlasting dual-purpose question.

The cows of Iowa and Minnesota are very largely dual-purpose because the farmers will have it so, they tell us. They can make so much more money feeding their very abundant fodder and grain to a cow that returns them $19 as in Iowa, and $23 as in Minnesota, than $55, as is the case in New Hampshire, where the special-purpose cows more generally prevails.

It will be noted also that in McHenry, Cook and Kane, the three great milk shipping counties of Illinois, where the prevailing breed of cows is Holstein, that the returns are only moderate. This is due to the unwise ideas the farmers in those counties have of buying their cows mostly, milking them a year and then selling them for beef.

There can be no real dairy progress or improvement in the quality of cattle where such a loose and unprogressive practice is in vogue.

Wherever the mixed beef or dual-purpose idea governs the farmer in the breeding of cows, there will be found the lowest average returns per cow.

A NEBRASKA DAIRY BULLETIN.

There has been lying on our table for some weeks, awaiting an opportunity for more extended comment, a bulletin from the Agricultural Experiment Station of Nebraska, detailing experiments with the dairy herd at that station. It is divided into three parts, treating respectively of the herd results, ration tests for dairy cows, and the best week in a cow's lactation period, and gives the results of experiments and observations by the Professor of Dairy Husbandry, Mr. A. L. Haecker, son of Prof. Haecker of Minnesota.

This bulletin is of exceptional interest and value to the dairy farmer because it deals with the plain facts as they developed from time to time and year to year.

The herd was established in the fall of 1896 by the purchase of ten grade Jersey heifers about two years old, due to calve in the late fall and early winter. These heifers cost, delivered in Lincoln, $32 each. Two other animals were obtained from local parties, of different breeding, one being a full-blooded Jersey and the other a cross bred with Jersey dam and Short-horn sire. During the five years covered by the records, considerable changes were made in the herd, both by purchase of new animals and sale and death of others. Following is the total and average production of this herd for five years, the amount of butter being estimated by adding one-sixth to the amount of fat in the milk:

YEAR.	No. of cows in herd.	Total butter fat produced.	Total butter produced.	Average butter per cow.
		Lbs.	Lbs.	Lbs.
1897	10	2927.73	3409.82	340.98
1898	11	3478.14	4087.85	368.89
1899	14	2964.45	3458.46	247.03
1900	7	1676.71	1956.03	279.35
1901	10	3029.38	3534.29	353.43
Average of 52 yearly records		270.70	315.82	

Prof. Haecker's comment on this showing is that the results obtained from this herd are not abnormal and can be equalled, if not surpassed, by any farmer or dairyman in Nebraska. No effort was made to crowd or force any animal to a high record. Young stock were principally disposed of in the form of veal, but exceptional heifers from some of the best cows were saved. Including all the animals in the herd, which contained both good and poor producers, the average yearly yield of milk per cow was 5,833.17 pounds containing 270.71 pounds of butter fat equivalent to 315.82 pounds of commercial butter.

Under the head of ration tests for dairy cows, a report is made of a feed experiment with alfalfa against prairie hay, the conclusion of which is that normally cured alfalfa hay is better for both milk and butter production than wild or prairie hay. Corn silage and sugar beets were tried against each other. The conclusion is that corn silage can be produced much cheaper than sugar beets, will keep fresh much longer and give slightly better results when fed to dairy cows, but the difference is so small that they may be said to be approximately of equal feeding value.

In order to form a judgment as to the best week in a cow's lactation period, 239 yearly records were studied, with the result that nine-tenths of the cows made their best records during the first ten weeks of lactation and that over one-half made their best records during the first month. It is to be remembered that these were not forced, short-time records, but were deductions from the yearly records of cows that were not forced to make special short-term records. The conclusion is, commencing four days after freshening for the first week, it was found that the second and third week of the cow's lactation are the best, and there is not much difference between the two, but a cow reaches her highest production of butter fat at an earlier period than she does her greatest milk flow.

Nebraska dairymen, and especially those who have too much of an inclination to despise the special-purpose dairy cow, should have a copy of this bulletin and study its every page very carefully.

WHEN SHOULD THE FARMER COMMENCE HAYING?

The feeding value of hay depends upon its composition and rate of digestibility. There is a very prevalent opinion that the longer grass is permitted to stand before harvesting, the greater will be the yield, and that this increased yield will compensate, in a large degree, for the decreased rate of digestibility. The average farmer seems to be of the opinion that if his cows will eat any fodder without much waste, there is no necessity for him to make further inquiry as to the value of that fodder. The figures which follow, refute this contention very successfully. They are derived from actual experiments conducted at the Maine Experiment Station a few years ago. Two acres, as nearly alike in amount of standing grass as could be determined, were set apart for trial. The grass was cut, the hay made and stored under exactly similar conditions, except that on one acre the timothy was cut when in early bloom and that on the other acre, ten days past bloom. The hay was put in the barn in good condition where it was allowed to dry until Nov. 28th, when it was taken out of the mow and re-weighed. There was only a difference of 65 pounds in the weight of the dry hay and this was in favor of the hay cut in early bloom, but when we come to the digestible nutrients per acre, we see a very marked difference in favor of the early cut hay, to wit: 66 pounds of protein, 172 pounds of carbohydrates and 13 pounds of fat (ether extract).

PECENTAGES OF DIGESTIBLE NUTRIENTS.

	Cut in early bloom.	Cut ten days past bloom.	Difference in favor of early cut hay.
Protein	4.89	3.29	1.60
Carbohydrates	48.73	45.30	3.43
Fat	2.08	1.70	.38

POUNDS OF DIGESTIBLE NUTRIENTS PER ACRE.

Protein	170 lbs.	104 lbs.	66 lbs.
Carbohydrates	1575 "	1403 "	172 "
Fat	67 "	54 "	13 "

With these figures of actual trial before him, why should the farmer hesitate to commence his haying in season? There used to be a proverb among farmers that late cut hay "spent" better than early cut hay. This meant, of course, that the cattle ate less of the late cut hay and still managed to live, although, as a rule, some of them had to be "tailed up" in the spring. Nowadays, the practical farmer who keeps stock for profit, is anxious to have his stock eat all the feed that can be digested and turned to good account, because he realizes that all his profit comes from the amount of feed consumed, over and above that required for maintenance.

THE ST. LOUIS BREED TEST.

The preliminary draft of the rules and regulations governing the proposed Dairy Test of various breeds of cows at the St. Louis Exposition has been issued by Chief Coburn of the Live Stock Section.

Comment and criticism of the rules is invited by Mr. Coburn. The proposed rules are in short as follows:

A superintendent is to be appointed by the Chief, who will be paid by the Exposition and who will have entire control of the feeding, care and management of the contesting cows.

Said chief shall be governed by the rules and regulations approved by the Louisiana Purchase Exposition and as formulated by an advisory committee consisting of one representative of each of the associations furnishing cows for the dairy test, a representative of the Dairy Division of the United States Department of Agriculture, and two representatives of the National Association of Agricultural Colleges and Experiment Stations.

Each association participating in the dairy test shall recommend to the chief of the live stock department the name of the party selected to superintend the feeding, care and milking of the cows furnished by the respective associations, and such person will be appointed by the chief of the live stock department for the supervision of said work, and continue in office during the pleasure of said Chief Their salary will be paid by the exposition company.

Each association intending to furnish cows for the dairy test shall notify the chief of the Live Stock Department of the World's Fair of such intention, on or before May 5, 1903. A statement giving the names and pedigrees of all such cows must be furnished not later than April 1, 1904; also the number of calves each cow has produced, the date of birth of the last calf, and the date of last service of bull since the last calf was dropped.

A statement must be submitted giving the method and character of feeding that has been followed with each cow one year previous to entry in the dairy test.

Classes: The cows shall be divided into three classes: Class "A," class

"B," and class "C." In class "A" herds shall consist of twenty-five cows, in class "B" herds shall consist of fifteen cows, and in class "C" herds shall consist of ten cows. Only cows of the Devon, Brown-Swiss, Red-Polled and Dutch-Belted breeds shall be eligible to entry in class "C."

The commercial valuations of all food used in the test shall be fixed by the chief of the live stock department, upon the basis of quotations on April 1, 1904.

The milk from each cow shall be weighed immediately after each milking, and a correct sample taken, and the amount of fat determined, under the supervision of the chief of the Department of Agriculture of the Exposition, by the Babcock method. On Monday and Thursday of each week a test shall be made by the lactometer of the milk from each cow. From these and other tests the amount of fat, total solids and solids not fat, etc., shall be computed, and their value determined for each individual cow and herd as specified below.

The milk produced each day from each herd of cows shall be weighed without unnecessary delay and taken in charge immediately by the chief of the Department of Agriculture of the Exposition, to be churned, tested and otherwise manipulated under such rules as will be formulated for carrying to completion the purposes for which the entire test is designed, and for determining the various products of each cow.

Sample prints of butter, free from *artificial coloring matter*, and broken to show grain, together with samples of whole milk shall be on exhibition in the Dairy section of the Department of Agriculture of the Exposition.

The products of the milk will be valued as follows:

The value of the butter made shall be the average of the highest quotations at St. Louis on April 1st, 1904, as determined by the Chief of the Department of Agriculture.

The value of solids not fat shall be based on the highest quotations for New York State factory Cheddar cheese in New York City on April 1st, 1904, as determined by the Chief of the Department of Agriculture.

Prizes shall be awarded as follows:

In class "A, B and C": A prize shall be awarded for the herd showing the greatest net profit, butter fat alone considered.

For the herd showing the greatest net profit, butter alone considered.

For the herd showing the greatest net profit in solids not fat.

For the herd showing the greatest net profit in total solids.

Awards and Records: The Chief of the Department of Agriculture shall provide uniform packages for all butter produced by each breed as may be determined by the Advisory Committee on Tests, and the score on such butter shall be kept daily and submitted each week to the Jury appointed by the Chief of the Department of Agriculture to determine the quality. Said jury will judge butter upon the following scale of points at the values indicated, viz:

Flavor	55
Grain	25
Solidity	10
Color	10
Total	100

A certified record of the report of said jury shall be made to the Chief of the Department of Agriculture and thereupon there will be credited to each breed the value of the butter produced by such breed in the following manner, viz:

Butter scaling from 75 to 80 points shall be credited at 25 cents per pound.

From 80 to 85 points at 30 cents per pound.
From 85 to 90 points at 35 cents per pound.
From 90 to 95 points at 40 cents per pound.
From 95 to 100 points at 45 cents per pound.

The sum to be credited daily to each breed for buttermilk and skim milk produced from the milk of such breed will be ascertained from the determination of the solids other than fat in such buttermilk or skim milk. Such solids other than fat to be credited to each breed daily at two cents per pound.

The increase or decrease in live weight will be credited or debited at four cents per pound.

The foregoing rules appear accurate enough to insure a fair contest, except in two particulars. (1) There is no sense in going any farther than to determine the amount of butter fat and solids not fat produced by each cow. This is to be a contest of cows, not butter makers. It should be confined absolutely to the products of the cow. Butter is not primarily a cow product any more than is cheese. Both require an after manipulation by men. Therefore if the contest is to throw a clear ray of light on the producing power of breeds of cows the determination should stop where the cow stops, butter fat and solids not fat.

(2) We notice that the matter of the increase or decrease of live weight, while the cows are in the contest, is to be credited or debited at 4 cents a pound. In the opinion of the DAIRYMAN this is all nonsense. If the beef breeds wish to come into the contest well and good, but flesh making has nothing to do with this matter. Suppose draft and trotting horses enter into a breed contest for speed. Would it not be deemed ridiculous to provide that any increase or decrease of live weight, should be taken into consideration by the judges?

We object most earnestly to this provision of the rules. Let it be a dairy test pure and simple, and let the cow win that can produce the largest amount of milk, butter fat and other solids in a given time in proportion to the cost of feed consumed.

Building a Round Barn.—The Best Style of Cow Stall Wanted.

ED. HOARD'S DAIRYMAN:—I am manager of a farm containing 700 acres and am building a round barn 85 feet in diameter with a 20 foot silo in center 60 feet deep. This barn is to have a self supporting roof and not a timber in it between the silo and out side. The cows will head to the silo and the barn will tie 75 cows in one row. The manure will be run out of the stable in a car on an overhead track into a manure house and dumped into wagons and drawn to the field, every day. Shall use some of the cow stalls so as to give cows best accomodations possible. Would like you to recommend the best one.

Grand Isle, Vt. E. J. PARKER.

Not having tried all the different styles of stalls we are in no position to advise as to which may be the best. We have several reports from those who have used the stalls advertised in the DAIRYMAN, expressing entire satisfaction with them, and some going so far as to say they cannot be improved upon.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Cheese Making Value of Milk.

Is there as much difference in the value of the milk between the Holstein and Jersey in the cheese factory as there is in the creamery.

Chittenango, N. Y. W. H. L.

The fat in milk is a very accurate measure of its cheese making value. In saying this, we do not mean to be understood to say that 4 per cent milk will make one-third more cheese than three per cent milk, but it will make more cheese and cheese of better quality, so that when quantity and quality are both considered, the four per cent milk is worth fully one-third more than three per cent milk for cheese making purposes.

There is in cheese, approximately, half as much water as fat and casein combined. In other words, cheese as it is sent to market is about one-third water, a little more than one-third fat and something less than one-third casein. The fat in the milk carries with it its due proportion of water into the cheese, the same as the casein does. In one hundred pounds of four per cent milk there is one pound more fat than in one hundred pounds of three per cent milk. If the fat carried no water with it into the cheese, then one hundred pounds of four per cent milk would make one pound more cheese than three per cent milk and would be worth that much more; but inasmuch as the fat carries with it one-half of its weight in water, we should expect one-hundred pounds of four per cent milk to make at least one and one-half pounds more cheese than one hundred pounds of three per cent milk.

In order to verify or disprove this reasoning, some years ago, Mr. Decker, then connected with the Wisconsin Dairy School and now connected with the Ohio Agricultural College, made up some 3.3 per cent milk into cheese, some 4 per cent milk and some 5 per cent milk, using one hundred pounds of each variety of milk. When the cheese came from the press, it was found that one-hundred pounds of 3.3 per cent milk had made 10.1 pounds of cheese, one hundred pounds of 4 per cent milk had made 11.4 pounds of cheese and one hundred pounds of 5 per cent milk had made 13.1 pounds of cheese. Set out in tabular form, these results show as follows:

100 lbs. 3.3% milk yields	10.1 lbs.	cheese
100 lbs. 4 % " "	11.4	"
Therefore:—		
0.7 lbs. fat yields	1.3	"
Again:		
100 lbs. 4% milk yields	11.4 lbs	cheese
100 lbs. 5% " "	13.1	"
Therefore:—		
1 lb. fat yields	1.7	"

The above figures show that actual practice fully confirms the theoretical deductions. If it should be said that the cheese market does not discriminate between the quality of cheese made from four per cent milk and three and one-half per cent milk, we may say that the addition of four per cent milk to three per cent milk brings the average quality up, so that the cheese from the mixed milk will bring a higher price than cheese from a lower quality of milk. Hence, our original proposition is justified, and the fat in the milk becomes the measure of its cheese producing value.

As to the Overrun.

Our creamery received for the month of March, 138,937 lbs. of milk, out of this was churned 6,365 lbs. of butter, and 5,298 lbs. butter fat according to test, making an overrun of 1,067 lbs. Now will you please tell me whether this is right or not. Would you divide by six in the amount of pounds of butter fat or butter to find the overrun.

Minnesota. SUBSCRIBER.

We have never known the over-run to be figured on anything but the fat, and in the case mentioned, there was an overrun, or an apparent overrun, of a trifle more than twenty per cent. This is practically impossible if the butter is of standard commercial quality, and indicates either that there was some fault with the glass-ware connected with the test or that the tests were read a trifle too low. An overrun of 16 2–3 per cent is all that can be expected when every proceeding is of the highest quality—separators run to leave practically no fat in the skim milk and the churning very exhaustive. It is very seldom indeed that creameries, even large creameries, can do as well as this, and an overrun of one-eighth, or twelve and one-half per cent, should be considered as first-class average work.

Inbreeding.

In your answer to inquiry of J. F., in issue of April 3rd, you speak of a mature bull purchased by you, his owner "having a prejudice against inbreeding." Is there no objection to inbreeding?

I have a mixed dairy herd of common cows, the Jersey blood rather predominating. I have a good registered Jersey bull nearly five years old. Can I breed him to his own daughters with advantage? If so, can I breed him to his grand-daughters with advantage? L. T. T.

Seattle, Wash.

How Far is it Safe to Inbreed.

I would like to know how far it is advisable to inbreed with a Jersey bull on a herd of cows ¾-Jersey, but no relation to the bull above mentioned. Also how often it would be wise to use a bull for service at 14 months old. A. R. G.

Merced, Calif.

As we have said more than once, and quite recently, in our opinion, it is not so much a question of relationship as it is a question of quality which should govern in this matter of breeding. In our registered herds, we do not hesitate to breed a sire back to his daughters and, sometimes, even to his grand-daughters. We would not do this if we thought that we could conveniently get better sires; neither would we do it unless well satisfied that there was no taint of disease about the sire, or any objectionable qualities of disposition or conformation.

Inbreeding intensifies defects, perhaps even with greater certainty, than it will intensify good qualities.

In our own herd, it most usually happens that we have a youngster, one or two years old, from a favorite cow, which we use for the grand-daughters of the head of the herd.

No general rule can be given as to the amount of service that it would be wise to require of a fourteen months' old bull, so much depends upon varying circumstances.

Figuring Fractional Percentages.

A Wisconsin butter maker is having some misunderstanding with one of his patrons in regard to the fractional percentages in skim milk and buttermilk and asks us to explain, if we can, the difference between .05 of one per cent and .13 of one per cent. Possibly, the most satisfactory way to explain this is to write it out in full, in words, thus, .05 of one per cent is read five one-hundredths of one per cent, and .13 of one per cent is read thirteen one-hundredths of one per cent. It should be easy to understand that thirteen one-hundredths is more than five one-hundredths just as thirteen is more than five. Therefore a thousand pounds of skim milk testing .05 of one per cent of fat would contain .5 of a pound of fat. If it tested .13 of one per cent, it would contain 1.3 pounds.

Plan for Small Barn and Stable

Please give me plans for cow and horse stable. I would like to have six cow stalls and two horse stalls, also a box stall for a horse and one box stall for a cow. Would like to have a cement floor for both horses and cows. Cows to have gutter behind them to catch the droppings. I will not want a very large entry. I would like a small bin down stairs for feed. Up stairs to be used to keep forage in. Please give me length, width, number of windows and number of ventilators. Give a good system of ventilation. Will want only one entry for horses and cows. S. L. D.

Hydes, Md.

We would advise this inquirer to build a barn or stable not less than 34 feet wide and 36 feet long giving an inside measurement of 32×34 feet. Make the entry way, so called, 8 feet wide and in the center of one end. In entering here, on one side will be first a stairway three feet wide leading to the loft; adjoining this, a feed bin three feet wide; then a passage way three and one-half feet wide; next to that standing room for six cows (21 feet) and at the far end another passage way three and one-half feet wide. Commencing at the entrance on the opposite side will come, first, a harness and tool room four ft. wide, two horse stalls ten feet, a box stall 12×12 for horses and another 8×12 for cows. For ventilation, put in a flue at the end of the barn opposite the entry, about 18 inches square with an opening out near the floor that can be closed at will and another one just below the ceiling that can also be opened and closed at will. The former will be used in winter time to draw off the cold and vitiated air and the upper flue in summer time to let out the heated air. Provision should also be made on opposite sides of the stable for the ingress of fresh air, as has been described in these columns almost times without number. A common window does not suffice for this, because when open, it lets out the warm air which is particularly needed in winter time. Therefore, the outer opening of the intake flue should be at least three feet below the inner or discharge opening in the stable. This will let in the cold pure air where it will mix with the warm air at the top of the stable and quietly descend as the main ventilating flue draws off the cold and impure air near the floor.

Weight of Milk and Cream.

What is the standard weight of whole milk, skim milk and cream? In other words if I sell whole milk by the gallon, what weight should I allow? W. H. S.

Barnesville, Oh.

The average weights are as follows:

Milk, 8.6 pounds per gallon; cream, 25% fat, 8.4 pounds; skim milk, 8.7 pounds.

The weight of cream will vary according to the amount of fat contained as follows:

Cream 20 % fat		8.46	lbs.	per	gallon
" 25% "		8.40	"	"	"
" 30% "		8.34	"	"	"
" 40% "		8.22	"	"	"
" 50% "		8.10	"	"	"

How Much can a Creamery Afford to Pay for Cream.

A party is putting in a skimming station about 30 miles from Port Huron, and he wants to sell us the cream and he expects to buy the cream by the Babcock test. Now, could you tell us what per cent I would have to give him for the cream so we could get a small profit by churning it and also make him a fair profit for his investment?

Port Huron, Mich. C. C. C.

Cream containing 30% fat will make 18% more standard commercial butter than there is fat in the cream. That is to say, 100 pounds of fat in 30% cream will make 118 pounds of butter. Our inquirer can estimate for himself from these data how much he can afford to pay for cream. It costs more and is therefore worth more to make butter in some localities than in others. The amount of milk or cream handled also is a factor in determining the expense. If we assume that 3 cents per pound for making butter affords a fair margin of profit to the creamery man, he can afford to pay 20 cents per pound for fat in cream when butter sells at 20 cents and when butter sells at 25 cents per pound, fat in 30% cream is worth 26 cents per pound, provided cost of manufacture does not exceed 3 cents per pound of butter.

Silo—Hilee, Hilo!

(It Vas Continued.)

DEAR GUFFERNER:—Well, I bromished, so I got to do it. Lem me see, ware I leafe off—oh, yes, I knows: I was telling dat I knows some mens wat dont like souerkrout oder beer, und dat dont brove nodding. Nossiree. Shall I tell you wy a few have quit using deir silo —und deys mighty few you bet. All right, iff you want to know, chust listen: Do you tink you would like to drink sour beer? Well, I guess aber nit! De brewer oder de saloon man wat would set you before dat you'd go back on gwick, wouldn't you? Well, its chust so mit a cow. Gif her sour silo, und she dont want it; und if you make her eat it she's going back on you. Fursht she gifs you bad milk und byme by her shstomack gifs out und your cow is shpoiled. Sour is all right in some tings, like bickles oder herrings oder bigsfeet, und such, aber not in silo. Den de fellow wat fed his cows sour shtuff he blames de silo. I subbose its human natur to shove de blame off of oneself. But dat man's failure dont brove dat silos is no goot no more dan it would brove dat beer is no goot because a fellow oncet give you some wat was sour. Nossir. Iff de silo—oder I guess de brobber name is silage—if de silage iss not shweet, und chuicy, mit a light brown color, und a shmell so fine dat you feel like takin a moutful yourself efery time you go in to take some out, den its de fault of de man wat put it in dare. Now dats a shure ting—you can take boison on dat! Iff you will foller a liddle more mit me I will show you more blainer wy some off dem early silo mens gif it up for a wile, und I will also show you wy all dose wat use dem now und use dem right is so crazy for dem.

You see wen de idea fursht came out about silos, all tought one should put in green shtuff, und de greener de bedder. Wy, I remember well yet wen I seen fellows cut whole acres of corn so green as Chune grass, mit no ears a tall on yet, und fill up deir silos mit. Dat used to be de idea in dem days—dey wanted green fodder for winter; und wat dey git: A lot of sour shtuff worser for cows dan goot souerkrout. De more greener it was put in de more sourer it got; und wen dey gafe de cows a little too much, well dey got sick, in several reshpects. Wen dey gafe dem blenty of hay und cornshtocks mit, und lots of grain, it done poody goot. Well, some shtuck to it und learned; und odders gif it up undill dey had learned; und may be some will nefer learn.

Aber wat is de teory now? greenfodder? Nixy, nix kummeraus! Its fres suckerlent shtuff de silo man wants for filling, aber *ripe* mit corn deviluppt, und leafes und all full of wat you call it, pro—protine, dat's wat makes muskel und milk, iff you give mit it as much water as dey want to drink. He dont want corn dat is mostly shtocks eidher; nossir, its got to have lots of rich, ripe, golden corn on it, so dat wen it's cut into a silo it will come down like a shower of green backs und gold neggets. Yessir. Cut it fine, gwarter of an inch iss long enuff, und it will seddle solid und gif you a silage wat will dempt youself to eat it und make de cows shmile, und all kinds of life shtock und de hens und hoggs lick deir chops wen dey only chust oncet tink of how good it tastes. Talk apout such shtuff making a cow sick! Well, if you say dat you dont know wat you're talking apout. I gafe my cows last winter wen I fursht started on silage *one hundred bounds a day*, by shcale weight, chust to see how it worked; und it worked fursht trate. Oh, you needn't laugh; I dont mean mit "worked" wat you mean. Nossir, it had no effect on dem except dat dey gafe more milk. I gafe dat for a week; aber when I commenced to figger I found my silo would not hold out, so I cut it down to fifty bounds a day und gafe each cow tree bounds of bran mit oderwise dey got nodding but cornshtocks und water. Afterward I found I had to cut down shtill more, und den I gafe und now gife dem dwenty-five bounds a day, aber more cornshtocks. I got chust fife cows und one of dem, as I have already said, freshened way back in August; aber I tell you wat dem cows did during de tree monts wen I gife dem lots of silage. In Detzember, Chanuary und February, I got for my milk at de creamery $152.90, und I sold 53 quarts for $2.65, und used in my family 345 quarts, (dats a lots, I know, aber you seed de rest of my family dont drink no beer, only Peter) wich iff sold would have been wort $17.25 more, und dat makes a total of $172.80. Und dey're doing ferry goot now yet, only I cant gife dem enuff silage no more. Now dont tink because I got my silo a liddle too schmall you ought to build a great big one. Dont you do it. Iff one aint big enuff bedder you make dwo und feed out one at a time. Dare aint so much surface exshposed, on top, in a little one, und wat you haf to feed off efery day is in bedder conditions.

Now one more ting den you got to shut up mit your obchecktions. Furst, you know by dis time dat fifty bounds of *goot* silage, ten oder dwelfe bounds of hay or bright oat shtraw, und some cornshtocks mit goot water, will keep a cow in goot milk und goot condition, don't you? Well, second, you know, und iff you dont, you can find it out, dat one acre of goot corn will cut from ten to dwelfe tons, und oftener more dan less, of goot silage, and dat, wid a liddle hay or shtraw und cornshtocks, will give tree cows a heavy nuff ration for nearly six monts, und a fine ration if you give a liddle bran oder ground oats mit. Dird, you can cut and house for keeps a whole fife-acre dract of corn so as to keep it fresh und in de finest conditions for winter, in a single day, und you got no bodder mit husking oder shocking oder taking care of de shtocks oder grinding up de corn, und your field is right away reaty for de plow. Off course you got to haf some corn for de hoggs und dat'll gif you some cornshtocks for de cows wen you let dem out in winter for exercise. Dey's got to haf exercise und de cornshtocks helps it along; aber you dont want more dan wat iss necessary. Watch you say? You chust so soon "feed eferyting in de goot old way?" Shucks, you makes me dired. On you all hops und maltz is ferloost. May be you like dat to go out und dig dem shtocks out of de shnow, heh? Oder may be you like to haul dat kind of manure, dat cornshtock manure I mean? Now you poody near makes me laugh! By Chimmney how mad I used to git efery time I had to load dat shtuff—only half rotten, und tuff und hanging togedder und shticking to de fork; my, it makes me uneasy wen I tink of it.

Yes, one ting more I want to tell you. May be you got a lot of shtuff wat ditn't get ripe, oder got a little catched by frost. Well, cut it und let it wilt in shock for a week oder dwo, den cut it in your silo if you got room, aber put on blenty of water wile you cut it in oder it will not mould. Oder may be you got more cornshtocks left dan you need, oder want. Cut dem in too, if you got room, aber dont forgit, *blenty* of water. Dat all makes nice silage wen done right, und it's out of de way. Aber, of course, it's not a balanxed ration; und wen you feed dat kind of silage you got to gif some grain along mit, oder someting. Such shtuff iss not wat we talk apout wen we

"ADVERTISEMENT"

WHILE YOU WAIT.

Thousands Write Me and Get Well.

Why do you stay sick while an offer like this is waiting?

Why not try to get well?

I will mail you an order—good at any drug store—for six bottles Dr. Shoop's Restorative. You may take it a month on trial. If it succeeds, the cost is $5.50. If it fails, I will pay the druggist myself, —and your mere word shall decide it.

If my way succeeds, think what it means to be well. If I fail, simply say so, and the treatment is free.

Remember two things. First, I know what this remedy will do, and the offer proves my faith in it. Second, it is apparent that I usually succeed, else the offer would ruin me. For your own sake let me convince you.

My success comes from strengthening the inside nerves, which alone operate the vital organs. I have spent my life in learning how to do it. A weak organ means weak nerve power. It is like a weak engine that needs more steam. To doctor the organ is useless; what it needs is power to act. My Restorative alone brings back that power, and in most of these diseases no other way can cure.

My book will tell you why.

Simply state which book you want, and address Dr. Shoop, Box 934, Racine, Wis.

Book No. 1 on Dyspepsia.
Book No. 2 on the Heart.
Book No. 3 on the Kidneys.
Book No. 4 for Women.
Book No. 5 for Men (sealed)
Book No. 6 on Rheumatis

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

A GREAT COMBINATION!

GOOD COWS AND A U.S. SEPARATOR FILL THE FARMER'S POCKETS WITH MONEY!

The U. S. Separator gets all the cream from the milk,
The cream makes the butter,
The skim-milk makes the calf,
All bring in the cash.

shpeak of *goot* silage, aber it's de best way to feed it up. For *goot* silage, someting dat you will be broud off, wat will make de cows laugh for choy und take off deir hat for you efery time you meet dem, you should use de best corn wat it gifs on your farm, mit leaves matured und chust starting to turn, und de ears poody close to ripe.

Dare now, Mr. Gufferner, be you satisfied? Didn't I tell you I could make it blain to dem fellows on wich side of deir bread was de tickest butter? Aber anyway I wont write any more to-day—my fedder shcratches on de baper like sixty, und I got to git me a new one before I can write some more. Oh say, I goin to send you some names of some farmers wat dont take de DAIRYMAN yet und dont got no silo. You send dem a sample copy, und iff dey refuse to pay for it, I will. Fery truly yours,

AUGUST FRIEDERICH WILHELM SCHWERTFEGER.

Jefferson, Wis.

Milk Production.

Dry Teat Milking.

ED. HOARD'S DAIRYMAN:—After being engaged in the production of milk for just 30 years, and 15 of these years being engaged in producing sweet cream and milk for wholesale and retail purposes, it has stood me in hand to study best methods of caring for the product. My opportunities for testing different methods have been very good. Have studied the problem in Texas and Tennessee, where in former state we had artificial ice, but in latter no ice at all. Climatic conditions in Tennessee were such that my method was thoroughly tested. Shipped cream in eight and twelve-gallon cans 185 miles during the entire summer successfully, also at same time shipped both cream and whole milk a distance of 45 miles, where the whole milk was inspected by United States Government experts as to condition.

Here at Cedar Hill, have shipped cream 30 miles during summer months for a retail milk route, for past four years, and sold bottled cream in our own city. This bottled cream we sold on a guaranty to keep sweet three and one-half days, or no pay, and to date one ½-quart bottle has been reported sour within the limit. How do you do this? you may inquire. Not by any red tape, white suit, covered pail, or dry teat milking. We conduct too large an establishment to waste time or money in gingerbread extras. When a dairyman tells me he practices dry teat milking, I know he either does not milk cows himself or does not state facts. It is physically impossible to milk any herd of cows and keep their teats dry. There are a few cows in every herd that can be milked with dry teats, but they are the exceptions. I visited a dairy herd some time ago that advertised in a neat booklet that they milk with dry hands. The proprietor of this herd is a stickler in his methods, but all the same I saw his men wipe their hands on their overall legs repeatedly to keep them dry when milking short teated cows. This same dairyman used cotton cover milk buckets, and in the bottle washing room I saw the boys take up a nest of bottles on their fingers and plunge them in what they called scalding water, their hands being snbmerged in the water.

My method of milking will insure a strictly clean milk that I am willing to place beside any milk in the country as to pure keeping qualities, and this method will appeal to over worked dairymen who are not blessed with a large force of men. First, the stables must be so constructed that cows keep clean and dry, plenty of windows to admit sunshine, then the milking done properly. It is admitted by all that bacteria getting in pails at time of milking is greatest source of contamination, hence covered pails, dry teats, etc.

If we can devise a method just as good requiring much less work and expense, have we not reached some results in a more common sense manner? We think so. Granting a sponge and pail of water cleans udder, our method not only avoids this washing but at same time eliminates at once bacteria dropping into the milk, and also keeps cows teats sound and free from chaps, warts and cow pox and in case of hard milkers or one with short teats, the milker does not get his hands wet. We take a small amount of vaseline on fingers of right hand, sit down to cow and with left hand brush off flanks and udder, then anoint teats, and after teats are lubricated rub both teats and udder with palm of hand.

This fixes any dust or bacteria that might drop off during milking and the ease of milking will astonish any one who has not tried this method and the most surprised party will be the cow herself if she chances to belong to a dry teat advocate. BUFF JERSEY.

Mommouth, Ill.

The Cost of Ensilage.

Making a careful estimate and taking into consideration every expense, as use of horses, board of men, and twine used, the total expense of putting up a ton of silage this year has not cost us on an average over 75 cents. If we estimate the use of our tub silo which has stood five years, and is still in a state of perfect preservation, at $25 per year, we are getting silage from standing corn to silo at a cost of less than one dollar per ton. The cost of growing corn for silo does not exceed 50 cents per ton, hence silage all ready for the stock need not cost to exceed $1.50 per ton. Perhaps the beginner could not grow and put up silage at this low figure; however, we believe that Yankee ingenuity will sooner or later bring the cost of putting up silage to even a lower figure than this.—A. W. TROW—in *Farmer*.

CONCERNING OUR ADVERTISERS.

Those who are in the market for profitable dairy cattle—milk cows of pure Jersey blood, as well as grades of that breed—should not fail to attend the closing out of the Polk dairy herds at Greenwood, Indiana, on May 20 and 21, as advertised in another column. "Polk's Best" is a trade mark consistently applied to the products of the J. T. Polk dairy and canning establishment, whether one has in mind the milk, cream, ice cream, tomatoes, corn or Jersey cattle. Catalogues containing full and accurate pedigrees and descriptions of these Jerseys will be mailed free on application to the Jersey Bulletin, Indianapolis, Ind., or to J. T. Polk, Greenwood, Ind.

There could hardly anything be offered for sale that evidently goes out on better guarantee than the "1900" Family Washer. They have an advertisement in this issue that proposes to send this washer free on 30 days' trial, a proposition that should establish the confidence that the machine is what the advertisers claim for it. The company, in making a proposition like this, certainly show their confidence in the public as well as their goods. Show this advertisement to the wife.

Split Hickory Buggies.

The opportunity to buy the celebrated Split Hickory Buggies direct from the factory is open to our readers. The season is here for using pleasure vehicles, and the longer their purchase is postponed the less opportunity one has for getting the full benefit of the season's enjoyment out of them. The Split Hickory line of vehicles is sold only direct to the user at the wholesale price, not being on sale at any store, nor is it handled by any jobber or dealer. The Ohio Carriage Mfg. Co., of Cincinnati, Ohio, sole makers of Split Hickory vehicles, is a highly reputable firm with a record of years of honesty and success as makers and sellers of high class vehicles at moderate prices. Their offer to sell their jobs on thirty days' free trial is bona fide and certainly very liberal. It enables the intending purchaser to see and try just what he intends to buy. A postal card or letter addressed to them at Cincinnati will secure their valuable new catalogue, containing all the latest things on four wheels, for people who like stylish, long-wearing and well-built buggies and vehicles. Send for it before you forget it.

Harvesting with Profit.

The "Milwaukee" Binder has several distinct points of merit, chief of which is the fact that it gets all the grain from the field. Farmers who are considering the purchase of a binder and who want that binder to "pick up" cleanly and thoroughly, at the same time combining the essential advantages of simple construction, accurate action, ease of operation and light draft, should send for the "Milwaukee" catalogue. It will be sent cheerfully upon request to Milwaukee Division, International Harvester Company of America, Milwaukee, Wis.

Our readers will notice the appearance this issue of the advertisement of the Studebaker Bros Mfg. Co., of South Bend, Ind. This great concern, we believe the largest of its kind in the world, is so well known as to require no introduction. Studebaker general repositories for the proper and convenient distribution of their products are found in most large cities while there is scarcely a hamlet in the country where the local Studebaker dealer is not found. There is nothing questionable about the character of Studebaker goods. The wagons and vehicles of every character, and harness for all purposes, are standard everywhere. Whoever is willing to pay a fair price for assured high quality is not disappointed in Studebakers. We unreservedly commend the advertisement to the favorable attention of our subscribers.

We have in this issue the advertisement of Stromberg-Carlson Telephone Co., Chicago, Ill., very extensive manufacturers of telephones, and

CHICAGO HOUSE WRECKING CO.
WEST 35TH AND IRON STREETS, CHICAGO.

PRICES OF CATTLE AND HOGS GO HIGHER

If you have a Stromberg-Carlson Telephone in the house you learn of any rise in prices, know every day what crops and stock are worth, get weather reports regularly and are in touch with all the world. With a telephone in operation you can call the doctor in case of accident or sudden illness, alarm the neighborhood if fire breaks out or any other emergency occurs. The Stromberg-Carlson Telephones have every modern improvement, are of great efficiency, cheap and durable, all parts guaranteed five years. Send for our free book F-15 on rural telephones. It gives illustrations showing styles, prices, etc.
STROMBERG-CARLSON TELEPHONE MFG. CO., CHICAGO, ILL.

there is no denying the fact that those of our readers who are not having the benefit of a telephone system ought at least to interest themselves sufficiently to send for catalogues and prices. These people have issued a new catalogue which they call F-15, and it is free for the asking. There is no way in which the investment of so small an amount of money can bring you more satisfaction, comfort and profit. The progressive men of every community are the ones who interest their friends and neighbors in improvements like this and shortly a system is installed. Now, good reader, what are you? Don't say you don't want it, because you know you do. Just write a card to these people, mentioning HOARD'S DAIRYMAN, and say you want catalogue F-15 and first know the cost of a telephone system in your neighborhood.

On Wednesday, May 6th, the sale of Holstein-Friesian cattle from the herd of Mr. Arthur N. McGeoch will be held at Milwaukee, Wisconsin. At this time seventy head of this popular breed of cattle will be disposed of to the highest bidder, and the opportunity to secure some of these fine animals should be taken advantage of by all who are in need of such stock.

In making the selections for the sale, it has been our aim to include only such as we know have actual merit and the few that have not been officially tested, is not from any lack of capacity but from some other cause, the principal one being their freshening at a time when we were too busy with other work, to permit of our testing them. By far the greater part of the cows and heifers in milk have been so tested and the records made are an evidence of the value of the animal for dairy purposes.

For all who are already breeding Holsteins, this should prove a fine opportunity to add a few of the best to your herds, and for those who as yet have no pure breds, it will be a chance that should not be missed, as it is your price, not ours, that places the value on the animals.

Catalogues are ready and will be sent to all who may wish them and I would be pleased to have those who have received one, to look it over carefully and note the exceptionally high class of stock that is offered. The advertisement appears in this issue and all are invited to look it up. A hearty welcome is extended to all and will be pleased to have you with us at the sale. I am

Yours truly,
H. B. DAGGETT, Mgr.

"Station A," Milwaukee Wis.

DON'T PUT OFF

Seeing your friends and having them oin in for a good club of subscribers.

Cheese—American full cream, Twins, 13@13½c; Young Americas, 13½@14c: Daisies, 13½@14c; Longhorns, 12½@13c; low grades, 10@12c. Brick, fancy, 13@13¾c; low grades, 11@12c. Limburger, fancy, 12@12½c; low grades, 10@11c. Swiss, drum, choice, 14@15c; drum, No. 2, 12@13c; Block, choice, 12½@13c; block, No. 2, 10@11c.

Eggs—Strictly fresh laid, cases returned, 14c; dirties, 12c; seconds, 11c.

FOND DU LAC, Wis., April 27—Cheese—Sale of cheese today at the Dairy Board was 75c, daisies at 13¾c. Meeting next week at 4 p. m.

SHEBOYGAN, Wis., April 22—Cheese—On the Call Board here today 715 boxes of cheese were offered and sold as follows: 12 Twins at 12⅝c, 9 at 12½c; 68 Daisies at 13⅛c, 194 at 13c, 39 cases Young Americas at 13c; 81 at 12⅞c; 163 cases of Longhorns at 12½c, 149 at 13⅝c. Demand exceedingly strong and prices the highest of the season.

SHEBOYGAN FALLS, Wis., April, 22—Cheese—23 factories offered 1,154 boxes of cheese on the Call Board today and all sold as follows: 87 Twins at 12⅝c; 201 cases Young Americas at 12⅞c; 93 at 12¾c; 225 Daisies at 13c; 310 cases Longhorns, 13⅜c, 238 at 13c¼. Market active and strong.

PLYMOUTH, April 21—Cheese—Seventeen factories were represented on the Plymouth Board today and offered 697 boxes of cheese, 121 of which were passed on. The balance sold as follows: Thirty Longhorns, 13⅛c; 92 Longhorns, 13¼c; 84 Daisies, 13c; 243 Twins, 12⅝c; 69 Twins, 12¾c; 46 Young Americas, 12⅞c; 12 Young Americas, 12¾c. Market very active.

BOSTON, Mass., April 27—Butter—Demand for butter was a little improved today, but the prices went off ¼c on all grades. This was due largely to weakear advices from other markets and an unsettled condition. Other country produce was unchanged. Quotations: Butter—Creamery, western, extra, 23½c; western firsts, 22@22½c; dairy, 16@22½c; imitation creamery, 17@19c; ladle, 14@16c; box and print, 16@24c.

Cheese—Choice, 14½c; sage, 14; Wisconsin new, 13@13½c; fair, to good, 10@12c.

Eggs—Near by, 18c; western selected, 15¾@16c; fair to good, 15@15½c; Illinois, 16@16½c; western dirties, 13½@14c.

CANTON, N. Y. April, 27—Butter—Offered 415 boxes of cheese and 788 tubs of butter. Cheese large sold at 12c; Twins at 12⅜c; butter, 22¾c.

Latest quotations for fancy creamery: New Orleans, 25½c; Baltimore, 26c; St. Louis, 25@25½c; Cincinnati, 27c; Buffalo, 26c; St. Paul, 23½c: Minneapolls, 23½c.

WASHINGTON, D. C. April, 27—Butter—Market firm. Fancy extras at 25c. Fancy renovated 19c.

PHILADELPHIA, Pa., April 27—Butter—Market steady. Solids 26c. Near by prints 27c. Western 26c.

NEWARK, N. J., Apr. 27—Butter—Market steady at 23c.

Eggs—Storage packed 16½c; western firsts 16c.

TOPEKA, KAN., Apr. 25—Creamery butter, 24 to 25½c; dairy 17½ to 19c.

Cheese—Longhorns 13¾c; Twins 12½c; Daisies, 13¾c to 14c.

BALTIMORE MARKET.

BALTIMORE, April 23—Butter—Though the increase in the receipts have been small, the supply has been fully equal to the requirements. The movements of stock of all kinds, particularly creamery, has been very light, as the trade would only take what they needed from day to day, fearing a still further decline; hence, trading has been very conservative, and little, if any, improvement is looked for until prices reach rock bottom. Held creamery, unless strictly fancy, is neglected. Imitation creamery of choice to fancy quality is in brisk demand. Fresh sweet ladles are also in good request; but faulty stock is hard to move above the price of packing stock. Rolls—Sweet stock, arriving in good condition, meets ready sale; off stock is slighted. Storepacked continues in moderate supply and demand. Blocks and prints—The supply is about equal to the demand. The general market closes quiet and barely steady.

Creamery Separator, extras, 26c; firsts, 24@25c; seconds, 22@24c. June Creamery, extras, 23@23½; firsts, 21@22c; seconds, 19@20c; Imitation Creamery, extras, 20c; firsts, 18@19c; seconds, 15@17c. Iowa & N. W. Ladle, extras, — firsts, 17c; seconds, 14@16c. Ohio & Indiana Ladle, extras, — firsts, 16@17c; seconds, 14@15c. Roll, Ohio, extras, — firsts 14; seconds, 11@12c. Roll, W. Va., extras, — firsts, 13; seconds, 10@11c. Ohio Store packed, extras, —; firsts, 13c; seconds, 10@12c. West Va. Stored packed, extras, —; firsts, 12@13c; seconds, 10@11c. Creamery blocks (2-lb.) extras, 28½@29c; firsts, 26½@27½c; seconds, 24@25c; Creamery prints extras, 29@29½c, firsts, 27@28c; seconds, 24@25c: Md. Va., & Penna. Prints, extras, 27@28c; firsts, 25@26c; seconds, 21@23c; Renovated Butter, extras, 19c; firsts, 17@18c; seconds, 14@16.

Eggs—The receipts, so far this week, while not quite as heavy as last, have been fairly liberal, while the demand is active, and there has been a close clearance from day to day of all attractive offerings. The market closes firm and active at 15 cents. Duck Eggs—The supply is fully equal to the demand; our quotations for to-day's sales; the feeling is easy and prices likely to go lower at any time. Goose Eggs—The wide range in prices is owing to the irregularity of the stock arriving; it is only a matter of a short while that they will not be wanted at all.

Cheese—Offerings light; demand good; market firm. Some few winter made flats and small cheese are arriving and selling at ½ to ¾ cents under these prices.

N. Y. State—Cheddars, fine, 14¾@15c; choice, 14@14½c; fair, 13@13½c; Flats, fine, 14@14¼c; choice, 13½@13¾c; fair, 12½@13c; Small, fine, 14¼@14½c; choice, 13½@14c: fair, 12½@13; Ohio Flats, fine, 13½@13¾c; choice, 12¾@13c; fair, 12¼@12½c; O. Picnic, fine, 14@14½c; choice, 13¼@13½c; fair, 12½@12¾c; Swiss Cheese, fine, 15c; choice, 12½@13½c; fair, 10@12c.

301 Exchange Place. G. M. LAMB & BRO.

LIVERPOOL, April 27—Butter—Good United States steady 75s.

Cheese—Steady American finest, white 69s; colored 69s.

SOME BIG USERS
OF BOTH FARM AND FACTORY
CREAM SEPARATORS

As everybody knows all the big and long experienced users of Cream Separators are patrons of the **DE LAVAL** machines. Many commenced with other makes and nearly all have tried various different kinds but practical experience in the use of Cream Separators always means the eventual use of **DE LAVAL** machines exclusively.

The names below are those of a few of the big users of separators—all having from 20 to 200 Power or Factory machines and hundreds of Farm machines with their patrons as specified—all **DE LAVAL.**

Beatrice Creamery Co., Lincoln, Neb	5,000 machines
Continental Creamery Co., Topeka, Kas	3,000 machines
Franklin County Creamery Ass'n, St. Albans, Vt.	1,000 machines
Fairmont Creamery Co., Fairmount, Neb	1,000 machines
Littléton Creamery Co., Denver, Colo	1,000 machines
Manning Creamery Co., Manning, Iowa	750 machines
Faust Creamery & Supply Co., Salt Lake City, Utah	500 machines
W. G. Merritt, Great Bend, Kas	500 machines
Frank Dunning, Bedford Iowa	500 machines
Nebraska-Iowa Creamery Co., Omaha, Neb	300 machines
J. A. Danielson & Co., Lake Park, Minn	300 machines
E. G. Hammer, Goodhue, Minn	300 machines
W. C. Lubke, Kenyon, Minn	300 machines

These are just a few of the big users of **DE LAVAL** machines all of whom are now busily engaged in putting out hundreds more of Farm machines among their patrons as fast as the Shops can produce them.

A De Laval catalogue for the asking.

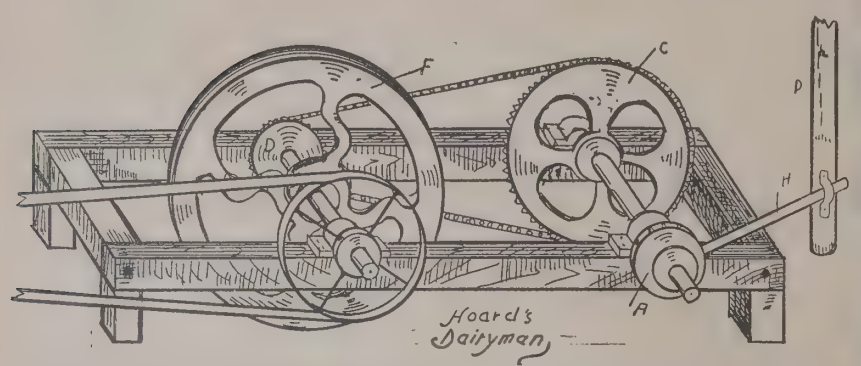
To Colorado in 1903—The passenger department of the Chicago & North-Western Railway has issued a very interesting folder, giving information as to reduced rates and sleeping car service, with a short description of the various points of interest in Colorado usually visited by tourists, these excursion rates applying on account of the Christian Endeavor meeting to be held at Denver, July 9th to 13th. Send 2-cent stamp for copy, to W. B. KNISKERN, Passenger Traffic Manager, Chicago. 9-6



Churning with Windmill Power.

ED. HOARD'S DAIRYMAN:—I am a subscriber to HOARD'S DAIRYMAN, and find many things in it that help me out. We are milking 14 cows at present and for the last two months they have returned us over $2 in creamery checks for each $1 worth of feed. Their feed consists of bran and corn and cob meal, equal parts by weight, and clover hay for roughage, (only charge $5 a ton to them for their clover hay). This is my first experience with clover and I find it is a big help. My cows come in from September to January.

I see F. A. of Deerfield, wants to know how to make his pumping wind mill turn a churn. I enclose a rough sketch and description of a machine that will do the work. C. A. WHIPPLE.

Nowthen, Minn.

Take an old mower drive wheel and break all of the rim off and all of the spokes but one, as A. Remove the other drive wheel and put A back on its shaft B with the clogs in drive wheel hub. Now make some bearings for the shaft B, on well platform, so point H comes as near in direct line with the pumping rod as possible. Connect point H with pumping rod, so that when the P rod goes up, it will raise H, turning the shaft B by means of the clogs in drive wheel hub, and as the pump rod descends, H will descend with it and the cogs will take a new hold, and you can get about ¼ turn of shaft B for each stroke of pump. Now put the sprocket wheel C on B, keying it fast; run a sprocket chain from C to pinion D on shaft K and heavy balance wheel F, keyed to shaft K-D, should make 8 to 12 revolutions to 1 of C. The thing should work like this: as the pump rod goes up, it gives ¼ of a revolution to C, if C is 8 times as big as D. F will turn twice around, while the pump rod goes up and then F should make nearly two more revolutions by its own momentum, while the pump rod is coming down. So for each up and and down stroke of pump rod you get 4 revolutions of F. Now put a belt wheel on K and connect with churn, and if you have got a fair breeze and a good steel windmill, the churn will go all right. Cog wheels will work just as well as a sprocket chain.

Mr. Wheaton's Canadian Dairy Notes.

Dairy Instruction Work for the Summer.—Cost of Instruction.—Water Content in Butter.—A Large Dairy Farm in Winnipeg.—The Dairy Outlook.—Mrs. E. M. Jones.

ED. HOARD'S DAIRYMAN:—Arrangements are now completed for dairy instruction work in Ontario this season. It will be remembered that last year two trial syndicates were operated, one in Eastern Ontario, and one in Western Ontario. During the present season twenty-five of these syndicates will be operated with an instructor over each one.

These syndicate instructors will be under the direction and control of two superintendents of instruction, Mr. G. G. Publow, in Eastern Ontario and Mr. G. H. Barr, in Western Ontario. Messrs. Publow and Barr are in the employ of the Government, and consequently the work of instruction this year will be more under the direct control of the Ontario Department of Agriculture than ever before.

In this syndicate work, Eastern Ontario leads, having secured twenty-one out of the twenty-four, thus covering nearly all the factories in that part of the province. Each syndicate will comprise about 25 factories, each one of which will contribute $15 towards the expenses of an instructor, the balance to be made up by a government grant through the dairymen's association. A total of $9,900 will be contributed by the factories in Eastern Ontario towards instruction work.

In addition to the four syndicates in Western Ontario two instructors for creameries, and one extra cheese instructor will be employed, making seven in all, besides Mr. Barr who will have charge of all the work. The syndicate factories in the West will each pay $10 towards the instructor's services and will receive at least five visits and more if possible, during the season. Factories outside of the syndicates will pay $3 for one visit and for two or more visits $2 per visit. The creameries will pay $5 each and will receive four or five visits each. It is hoped by this plan to reach every factory in the West, at least, once during the season.

Preparatory to beginning work, the instructors received a special two weeks' course of instruction at the dairy schools, those in the east attending at Kingston and those in the west at Guelph. By this plan greater uniformity in methods and practice should result. In the past there have been as many different methods followed as there were instructors, and the instruction lacked uniformity throughout any wide section.

This special course should help to obviate this and bring about more uniformity in the quality of the product. Besides, a superintendent of instruction will still further tend towards a uniformity of method.

An important part of the instructor's work, this season, will be to reach as many of the patrons as possible and aid them in the care of the milk. A great deal was accomplished last year by the two syndicates in this direction, and this side of the work will be further emphasized this season.

An increase of from two to twenty-five syndicates in one year is a pretty good indication that the dairymen of Ontario are desirous of keeping right to the front in the quality of their dairy products. The same rate of progress another year should see all the factories in this province grouped and under the control of competent instructors.

There has been some concern here as to the effect the bill, recently passed by the British House of Commons, making all butter sold in Great Britain, containing over 16 per cent of water, adulterated butter, will have upon our export trade. But Canadians need have little fear on that score. Last summer Mr. Frank T. Shutt, Chemist Dominion Experimental Farms, made a close examination of 105 samples of butter received from creameries in all parts of the Dominion. Out of these 105 samples only two showed more than 15 per cent of water and only one exceeded 16 per cent and it was made under such unusual conditions as to temperature,

That Tired Feeling

Is a Common Spring Trouble.

It's a sign that the blood is deficient in vitality, just as pimples and other eruptions are signs that the blood is impure.

It's a warning, too, which only the hazardous fail to heed.

Hood's Sarsaparilla and Pills

Remove it, give new life, new courage, strength and animation.

They cleanse the blood and clear the complexion.

Accept no substitute.

Hood's Sarsaparilla promises to cure and keeps the promise.

THE MILK SHIPPER

of all people is best fitted to judge of the merits of a milk can. He knows just what extreme hard wear a can is subjected to, not only in the milk car, but in the city delivery wagon as well. He knows what economy there is in toughness and smoothness, which mean wear, resistance and ease of cleaning. Because of this knowledge he

Has Set the Seal of His Approval

on the **Buhl Cans.** This is witnessed by the large number he has bought in the past and by his **repeated and ever increasing orders.** He never makes a mistake, because he has learned that any milk can stamped with the Milk Can Trade Mark is the best milk can for the money. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. All dealers sell them. Ask for the **Buhl.** Look for the Milk Can Trade Mark. No other Can so good.

Buhl Stamping Co.,
212 West Larned Street, Detroit, Michigan.

Getting the Milk Profit.

If you are interested in the milk business, either as dairyman or dealer, or are converting milk into any of its varied products, you should be interested in our magnificent line of

Dairy and Creamery Supplies.

Ours is the most extensive house of its kind in the West. Our line includes such standard articles as Milk Cans, Areators and Heaters, Milk Tickets and Stationery; Pails, Strainers and Dairy Tinware of all kinds, in fact a complete line of Milk Dealers' supplies. We also handle extensively Boilers, Engines, Churns, Butterworkers, Vats, etc. Amongst our specialties, manufactured solely by us, are Dairy Queen Churn, Boyd Cream Ripener, Success Skim Milk Weigher, Sturges Pasteurizer, Milk Heaters, Seamless Steel Cheese Hoops, Perfection Milk Coolers and 20 styles of Milk Cans. We are not a part of any trust, but an independent house furnishing high class supplies at a low margin of profit. The stock we carry is so varied that we publish a special appropriate catalogue for each department. Write us for anything you need in any way connected with the milk business, and we will mail you free the proper illustrated catalogue. We are sure to meet your every want and we guarantee to save you money.

WRITE FOR OUR CATALOGUE

Out of the 105, 92 fell below 14 per cent, and the average for the lot was 12.31 per cent of water. This is strong evidence that Canadian butter will not suffer, whatever other butters may do, when this bill is in operation.

A company has been formed at Winnipeg to conduct, so it is said, what will be one of the largest dairy farms in America. 1750 acres of land near the city, have been secured, on which the company propose to keep 600 cows, a large percentage of which will be Holsteins. This seems like a big undertaking for a new country like our Canadian west. But all new countries with large territories have big ideas, and we wish them every success.

The outlook for the present season has never been brighter for the Canadian dairyman, especially that for cheese. Old stocks are very light, prices are unusually high and the demand for new goods was never better. On April 1st., there were only 987 boxes of cheese in store at Montreal as compared with 53,034 boxes on the same date a year ago. Early fodder cheese has sold at from 13c to 13½c per pound, as compared with 10½c to 10¾c, for the same class of goods last year. Many contracts for April cheese have been made at 12½c to 12¾c, though the make of early goods is larger than it has ever been for years. Even if prices drop a couple of cents, as they are likely to do later on, there is big money in it for the dairyman.

What about butter? Well the outlook is not so rosy, though brighter than a year ago at this time. On April 1st the stocks on hand at Montreal were 4,608 pkgs., as compared with 5,142 pkgs. on the same date of last year.

Fresh creamery sold during the early part of April at 24c to 24½c at Montreal as compared with 21½c and 22c a year ago at this time. This shows an advance in price over last year and should help to extend butter making this season. These prices, however, are for the home trade. They are a little high for profitable export, and as soon as the make increases, and there is a surplus to export the price will have to come down to an export basis. But still the out-look is hopeful and there shoud be a large increase in our make of butter this season.

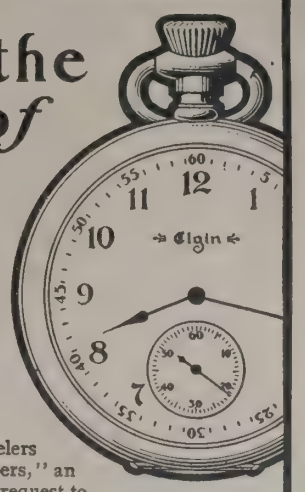
Many readers of DAIRYMAN, will regret to learn ot the death of Mrs. E. M. Jones of Brockville Ont., who passed away on April 7th last. Mrs. Jones was one of America's great breeders of Jerseys and had won a name for advanced thought and skill along dairy lines both in Canada and the United States. She had some of the most noted milkers of her day, such as Massena, who gave 650 lbs. of butter in her 16th year. Mrs. Jones was best known, perhaps, by her book, published in 1892 on "Dairying for Profit or the Poor Man's Cow." This book had a large sale and did much to stimulate better methods and more zeal in good dairying a decade ago.

Toronto, Canada. J. W. WHEATON.

Opening for American Dairy Products in South Africa.

Mr. G. M. Odlum, Special Agent, of the Rhodesia, South Africa, Department of Agriculture, is now in this country making a study of American methods of agriculture. Mr. Odlum is an American who has undertaken the management of a 13,000 acre tract of land in Rhodesia, and is endeavoring to place it on a paying basis by the application of American systems of farming. The dairy interests are very backward at the present time, but Mr. Odlum sees a great opportunity for dairymen to engage in business in that country. In speaking of Rhodesia and its opportunities for investment, he says:

"There is probably no country in the world where the dairy interests are so undeveloped, which, at the same time, promises such returns as Rhodesia. To start with, milk sells from ten to twenty-five cents per quart, butter at from fifty to seventy-five cents per pound, and yet nine-tenths of all these products used in the country are imported in the condensed or canned form, not because people prefer the imported article, but because the fresh article cannot be obtained. Some men have taken up both forms of the dairy business and have become wealthy, but they do not begin to occupy the field.



There are several reasons for this neglect of so important an industry, and the chief one is, that the Boers who make up the bulk of the farming population of the country know not even the elements of dairying and are too lazy to carry on the business if they did; then, most of the English farmers in the country were not farmers before they came, and dairying is not a business that can be picked up by instinct; and lastly, the cows of the country are not as a rule, good milkers, most of them containing a large proportion of native blood, or else are of Holstein blood greatly deteriorated by a hundred years of mis-breeding and non-selection. To most South Africans, a cow is a cow, if it has four legs. The fact of the case really is, that while the country was sparsely settled and before the recent development of cities there was really no demand for dairy products, and all that a man had too look out for was something that would give him a little beef and haul his wagon. And now when the country awakens to the importance of dairying, they find no animals, or, at the best, few, adapted to the purpose, and this brings about the necessity for importations of better blood. But importations mean money and risk, and thus most men are discouraged at the very beginning.

But some men like the Hon. Joseph Bains, of Nels Rust, Natal, balk at nothing. Mr. Bains has a fine, well-watered farm on which he has 20,000 head of cattle largely imported from Australia, an ideal dairy equipped with the best machinery, and a side-track of his own where the train stops every day to carry his butter down to Durban where it brings seventy-five cents per pound. Mr. Bains is making money hand over fist for himself, and is at the same time developing the country and pointing the way for others.

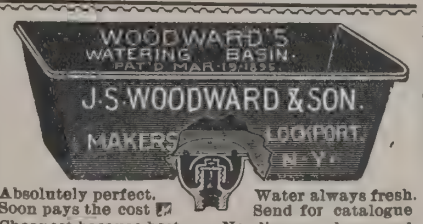
Large, well-watered farms may be obtained in any of the Colonies of South Africa and especially in Natal, the Transvaal, and Rhodesia. In the latter country 3,000 acres are given to every settler.

However, while South Africa is capable of producing all her own milk, butter, and cheese, still it will take years before it reaches that state of development, and in the meantime the people will have to depend upon imported articles, and it seems that there would be a splendid opportunity for American dairymen to dispose of their surplus. Of course some American condensed milk and canned butter are used there now, but there is too much that comes in from Europe and Australia for an American to be satisfied. And then more than this, why could not the fresh butter be shipped directly to South Africa? There is now a direct line of boats from New York to Cape Town, and it should not be difficult to get butter there in good condition; and in Africa we have cold storage and refrigerator cars so that it could easily be carried to such interior cities as Johannesburg. The people there are always sighing for fresh butter, and it would be genuine missionary work to send it to them. It would be necessary to have a good hustling American on the spot to push the business. The better American cheese might also take well, although the South African taste is educated to the European makes, as Cheshire, Stilton, Roquefort, and the Dutch Cannon Balls. Oh, yes, and eggs! South Africa imports most of its eggs, and there is no reason why they should not come from New York as well from Maderia."

Always on the right side of a question of time—the ELGIN WATCH

Every Elgin Watch is fully guaranteed. All jewelers have Elgin Watches. "Timemakers and Timekeepers," an illustrated history of the watch, sent free upon request to ELGIN NATIONAL WATCH CO., ELGIN, ILLINOIS.

Cronk's Improved Staple Puller



is at the front. Ask your dealer to show it. Three wire cutters, two hammers, two splicing clamps—all in one tool. A staple puller that will pull staples when no other make will. A cutter that will reach wire when the button cutter will not. One day's use will save the cost of it. $1.00, postage paid.

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

WASHINGTON, D. C., May 27, 1901.

The trial of your "Purifier" made at my request, interests me very much and strengthens my conviction that this "Purifier" is an article which, if it continues to produce the results attained the present season, is destined to be of great importance and value in many dairying districts of this country.

[SIGNED] HENRY E. ALVORD,
Chief of Dairy Division, U. S. Department of Agriculture.

The use of our "MRS. LEA'S MILK AND BUTTER PURIFIER" is a necessity to producers of milk and butter when the pastures are at all infested with Garlic, Onions, Rye or Clover. It is a great saving, as the cows can be grazed, thereby saving largely in feed expenses. It always removes the taints when properly fed. The best dairies are using it largely and with profit. Try it and you will find it to your interest. For sale by The Dairymen's Supply Co., Philadelphia, Pa.; Farmers' Exchange Co, Belle Mead, N. J.; Cook & Brady, Middleton, Del; Filston Farm, Baltimore, Md.; Gardiner Dairy, Balimore, Md.

Manufactured by VIRGINIA CATTLE FOOD COMPANY, Danville, Va.
Write Us for Prices and Further Information.

THE BROWN BESSIE HERD

Offers some splendid young cows and heifers bred to Recorder, the only living son of the famous **Brown Bessie,** winner of the 30 and 90 day butter test at the Columbian. Also a few sons of Recorder from daughters of Diploma and other tested cows are offered.

JERSEY CATTLE

of Island and English Breeding

Selected and imported by him for the American Market, and entered in the Herd Register of the American Jersey Cattle Club.

The English contingent was obtained from the very celebrated Chestall Herd of J. Reid Walker, Esq., Rugeley, Staffs, England, in choosing which Mr. Peer had the valuable advice and assistance of Mr. Frank Sugden, Agent of the Chestall Estate, one of the foremost judges and breeders of Jerseys in England.

Among several very valuable bulls in the importation are the world-famous GOLDEN FERN'S LAD and the very exceptionally bred BROOKHILL FOX, by Flying Fox out of Brookhill Rose 2d. Mr. John Thornton, of eminent authority, pronounced these the best two bulls in England. Many Island breeders regard the former as the greatest Jersey sire that ever lived. There are eight daughters of Golden Fern's Lad, and numerous get of such highly approved sires as Napoleon Bonaparte, Eminent 2d, Forfarshire, Hamley, Golden Lad 2d, Orlando, Flying Fox, Financial King, etc. Many of the females are bred to Golden Fern's Lad and Brookhill Fox. The cattle, now in the United States Quarantine Station at Athenia, N J., will be removed thense, with clean bill of health, directly to the place of sale on or before Monday, May 11, on which date they may be inspected by the public. Hexamer's Riding Academy is but three minutes walk in Hoboken from ferry and twenty minutes or less from New York City via ferries at Christopher and Barclay Sts.

For catalogues, ready May 5, address
PETER C. KELLOGG, 107 John St., New York.

READY FOR SERVICE

We are offering a solid color yearling Jersey Bull, 56 per cent blood of five of greatest Jerseys that ever lived; out of a young cow scoring 360 lbs. butter within a year, second season. Sound and all right, well grown and thrifty. A bargain at $100. For particulars address

O. KOOGLE, Ohio City Ohio.

ST. OMER HERD

Offers young bulls fit for service, out of tested dams with good yearly records. Strong in Exile of St. L., King of St. L. and Stoke Pogis of Prospect. Reasonabe prices. JOS. T. HOOPES, Bynum, Md.

MILK BOTTLES

Don't have to be sterilized. Sterilizing won't make them hold any more or any less milk. It will, however, insure the perfect purification of your jars which are to be refilled. It is absolutely necessary that this should be done if jars are to be perfectly safe for constant use.

OUR IDEAL STERILIZING OVEN

Is conveniently and substantially made. It is constructed of heavy galvanized iron throughout, with either wooden or galvanized iron shelves. The doors are packed with cork and close with special compression levers that always produce a perfectly tight joint.

Write us for full description.

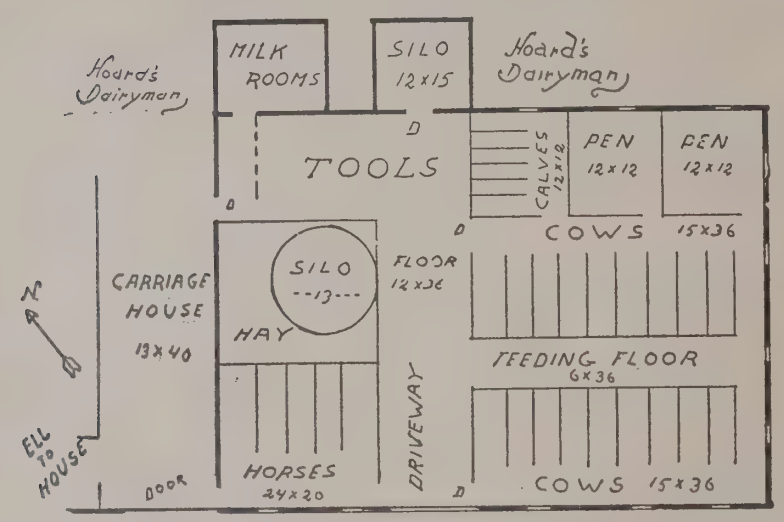
THOS. CAINES, Supt.



Remodeling a Dairy Barn.

ED. HOARD'S DAIRYMAN:—The proper stabling of animals, and the securing of sufficient room for their winter's fodder, are questions of vital importance to all dairymen in our northern climate, and they are questions that, in the main, lie at the foundation of successful cattle feeding. If the dairyman is to begin new, and design his own building, the task should be comparatively easy. When one has to take an old barn and refit it for a larger and a different line of stock feeding, the task is difficult.

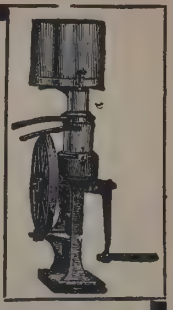
When we resolved to extend the work at the Pines, and to make the place a dairy farm, the question of a proper barn for the purpose, was the first one to settle. There was an old barn thirty-six by forty-eight feet, on exactly the spot where we desired a barn and the timbers were sound, the roof was well covered, so we set to studying and drawing plans, with the old barn as a foundation. A silo was needed so much that one was erected as a separate building, twelve feet from the north side of the barn.

PLAN OF FIRST FLOOR OF OLD BARN.

PLAN OF FIRST FLOOR OF REMODELED BARN 36×83 WITH LEAN-TO ON NORTH SIDE, 12 FEET WIDE. W. WINDOWS. D. DOORS.

The Pines, and to make the place a dairy farm, the question of a proper barn for the purpose, was the first one to settle. There was an old barn thirty-six by forty-eight feet, on exactly the spot where we desired a barn and the timbers were sound, the roof was well covered, so we set to studying and drawing plans, with the old barn as a foundation. A silo was needed so much that one was erected as a separate building, twelve feet from the north side of the barn.

Then from the plans we had drawn, we began our work, and gradually brought it to completion. One end of the barn was thirteen feet from the ell of the house, and the first move was to put a joint thirteen feet wide and four feet longer on the north end than the width of the barn, in that space. The first floor is a carriage house, the second floor is a work shop and grain room, the third floor is a corn chamber. The carriage house opens on one side into the stable, on the other side into the ell of the house.



Next, we put two joints, of twelve feet each, on the other end of the barn, the first floor of these being designed for cows, the second, as the storage for hay. This, in addition to the twelve feet we already had on that side of the main floor, gave us a room thirty-six feet square. Through the center of this room from the main floor to end of barn, we made a feeding floor six feet wide, and on each side of this floor a tie-up for cows. This gives seventy-two feet of room for tying the animals, and makes each tie-up fifteen feet wide and the cows stand in a double row with heads toward the feeding floor.

A lean-to was then run from the four feet extension of the first addition the whole length of the north side of the barn, filling the space between the barn and the silo. The thirty-six feet of tie up space on that side was left without boarding, and the lean-to was divided into three pens, each twelve feet square. One of these pens was taken for calves, one is used for a cow hospital, and one for a bull pen.

In this way we keep our bulls kind, because they are not isolated, our cows are turned to calve where the temperature is the same as where they have stood in their stalls, and where they are not lonesome, and our calves are where they can be easily tended and where they become acquainted with their feeders, and the older cattle.

Taking these three pens, the two cow tie-ups, and feeding floor between them and we have a space thirty-six by forty-eight in one room. This room is eight feet high, and in it, we have 13,824 cubic feet of space, or 5,529 cubic feet per animal, with the stalls all full, four calves in the calf pen, and one bull. This room is shut off from the main floor of barn, by the use of three slide doors, one in end of feeding floor and one in the end of each tie-up. It is well supplied with windows, and receives, in some part of it, the direct rays of the sun during the entire day. At this writing, the thermometer registers zero at ten a. m. The wind is blowing a gale, and as I stood behind our cows, so comfortably lying in their stalls, where no frost ever reaches them and where the air is pure and the sun is pouring in its germ killing rays, I wondered how many more times the exercise theory would have to be exposed and exploded before all dairymen who study their own welfare, will see with the senior editor of this paper, that a cow should be kept where she is the most

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.
First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.
The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.
The Reid is perfectly planned and strongly built, and it literally "runs like a watch."
As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**
There is a new (free) booklet about the Reid Hand Separator.
Sizes run from 150 lbs. to 500 lbs. per hour.

comfortable. Any plan of tying, any method of feeding, any arrangement of stable that adds to the comfort of the cow, adds to her health, increases her capacity and usefulness, and lengthens her life.

We use the Model system of tying. This gives each cow a stall by herself, and with the feeding rack for hay and the heel piece on the floor, the cows are kept perfectly clean. The deep drop is avoided. The heel pieces form a protection for cows heavy in calf when lying down, and help to keep the bedding under them.

The horse stable, with five stalls, is on the opposite side of the main floor. There are two windows in this room, and the sun, shining in during the short winter days, raises the temperature and dries the air.

In 1901, a round silo was built in section of large bay, and now we have storage capacity for 100 tons of silage. A track runs the entire length of barn, and hay is drawn into both ends with a horse fork. There is a basement under the barn which is warm and dry, affording excellent space for the storage of manure. Milk rooms have been built on north side of lean-to,and eight feet from them is the ice house, with covered driveway between. With running water conveniently located in these buildings, there is no necessity for stepping out of doors to do any of the work connected with caring for the stock, or loading the milk.

This, in brief, is an outline of the remodeled barn, which serves its purpose well, and which was secured at far less expense than a new one of nearly the same capacity could have been.

The rough drafts accompanying, may give a better idea of the changes and of the new barn, than one can get by reading the description.

I want to say a word in commendation of the narrow feeding floor with cows on each side. It is very convenient for feeding, as one feeds two animals without moving.

It affords a means for shutting the room without shutting a door in the cows' faces, and as it is devoted entirely to feeding, is never cumbered with any other material than the fodders for the animals. There may be others so situated that they can get helpful hints from these plans. B. W. McK.

Fryebrug, Me.

Clarified Milk.

ED. HOARD'S DAIRYMAN:—In your issue of April 17th, Mr. J. Moldenhawer, under the head of clarified milk, tells your readers, or at least conveys the impression, that I run my milk through the separator for the purpose of cleaning it; the fact is that the only thought in my mind when I conceived the idea of putting my milk through the separator was to standardize it. I hold my milk all the time at 4% fat and by the use of the separator am able to do this very accurately, making today's Babcock test the guide for tomorrow's work. We do this by catching out a portion of the skim milk as it runs from the separator, when the test is below four per cent fat, and when it is above four per cent fat we catch out some of the cream as it runs from the cream spout of the separator.

This is accomplished very simply by having a conductor with a partition in the head so that the cream may run into one side and the skim milk into the other side, and in the bottom of one of the compartments put a small valve that can be controlled to allow as much of the cream or skim milk to pass through it as is found necessary to make the standard of fat what you wish it to be. The valve is needed in but one side, as the spouts can be moved so as to have either the cream or the skim milk run into the compartment that has the valve attached.

I do not believe that milk is injured as a food product by being run through a separator; the cream does not rise as well as it does when it has not been through the separator, but this is no disadvantage, in fact it is an advantage to have the cream retained in the milk when it is needed there. If we wish to use skim or partly skimmed milk, it is all right of course to have the cream separated from the milk. In my work the milk is put through the separator in a few minutes after it comes from the cows and is run immediately back together, being separated but a few seconds. There is much theoretical talk about the action of the separator on the food value of milk but I have never learned that there was any injurious effect on the milk and I do not believe there is.

I am sorry that Mr. Moldenhawer got the idea that I use the separator as a clarifier in place of a standardizer. Of course the milk receives the centrifugal action when we employ this means to standardize it. H. B. GURLER.

DaKalb, Ill.

Success with a Shallow Silo.

ED HOARD'S DAIRYMAN:—We are using silage from the silo put up last summer. It is in fine shape. we feed about 30 lbs. per day to each cow in connection with corn and oats, meal and bran. My cows look good and are doing quite well. But the silo is what I wish to speak of. The plan was taken from HOARD'S DAIRYMAN. It is a wooden hoop structure lined with narrow southern pine flooring. The size is 14 feet in diameter, and height about 33 feet. On account of the wet season we had corn enough to fill one-third only of this silo, and only one man to place and tread down at the time of filling. Some of the corn was frost bitten and many weeds were in it. However, we thoroughly wet the whole mass after the filling, which no doubt saved the silage and proves the ability of keeping silage in a structure even 12 feet deep.

E. Onondaga, N. Y. A. B. C.

Plano Machines are easy workers because each part is sensibly and scientifically planned to serve its purpose with strict economy of power and wear. Designed by men who know the field conditions and the farmer's needs, built of right materials and stripped of needless complications, they save work and worry, time and cash.

With its patent Fly Wheel, simple, accurate Knotter and famous Lever Device, the Plano Binder handles the heaviest crops with ease.

With its self-adjusting Draft Rod, compact Gearing, linable Cutter Bar and handy Vertical Lift Device, the Plano Mower challenges criticism.

Our steel Hay Rakes are the easy working kind, but strong enough for any service and adjustable to fit the field.

THE MILWAUKEE LEADS

The ease with which the "Chain Drive" operates the **"Milwaukee"** Mower makes it a light draft machine. Being chain driven it has but few bearings, such as it has are adjustable to wear, therefore—no lost motion, but gives direct and great power—no backing up to give it a start as it cuts instantly. It virtually requires no repair expense as it is built staunch and true. The **"Milwaukee"** Mower covers all conditions of ground and cuts as close as you want it to, that's why it saves hay. Call on our Local Agents, they will explain all its merits—it has lots of them.

A Catalogue of all "Milwaukee" Machines for the asking.

COMMON SENSE
Calf Feeder

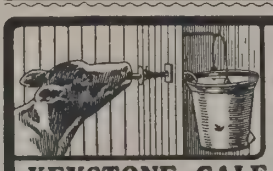
awarded Gold Medal at Pan-American Exposition. The only Feeder adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.



Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder**, I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

O. H. MANUFACTURING COMPANY, DEPT. H, LYNDON, VERMONT.

SENT out under positive guarantee. Money refunded if not satisfactory. No boiling food. Perfect digestion. All tinned—no rust.

KEYSTONE CALF FEEDER

Patented under No. 721,384. Used in about forty experiment stations. Mass. Ag'l College writes as follows: Mr. M. T. Phillips, Dear Sir:—I write to say that the Calf Feeder is giving excellent satisfaction. We have found it to be all one could ask for in a feeder. It is easily cleaned and appears to be durable. Yours truly, E. A. JONES, Supt.
Complete with extra nipple, $1.50, express prepaid. Circulars free.

EMPIRE

EASY RUNNING..... Cream Separators

It's a broad claim we make but **We Deliver the Goods**

More up-to-date creamerymen are pushing the Empire Cream Separator today than any other separator on the market. Why?

More up to-date dairymen delivering cream to creameries are buying the Empire Cream Separator today than any other separator on the market. Why?

More farmers are perfectly satisfied with the Empire Cream Separator today than with any other separator on the market. Why?

It's Altogether a Question of Merit.

We do not expect to sell a separator to every farmer in the land. We do not expect every creamery to take up the sale of the Empire. We could not accommodate all of them either with territory or machines. We know some of them are tied up with other manufacturers and cannot break loose, no matter how much they want to.

We do not bull-dose creamerymen. We do not threaten "to ruin them" if they sell another machine. We do not appeal for patronage on any grounds other than simple merit. We can take that position because the

Empire Cream Separator

Does the Business.

We have never yet known a live creameryman who has thoroughly investigated the merits of the several hand cream separators on the market, to undertake the sale of another machine if he could get an agency for the Empire. Here are a few of the wide-awake fellows who are selling the Empire:

Hygeia Creamery Company, Omaha, Neb.	Blue Valley Creamery Co., St. Joseph, Mo.	Ernest Karow, De Forest, Wis.
Geyer Creamery Co., Storm Lake, Ia.	Central Michigan Produce Co., Alma, Mich.	C. J. Dodge, Lodi, Wis.
Tri-State Creamery Co., Chicago.	The Dodge Creameries of Wisconsin and Illinois.	Osseo Creamery Co., Osseo, Wis.
J. D. Bickel Produce Co., McGregor, Ia.	Des Moines Creamery Co., Des Moines, Ia.	Comfort Produce Co., Bad Axe, Mich.
Jahnke Creamery Co., Watertown, Wis.	Longmont Creamery Company, Denver, Col.	A. Nolting & Sons, Elgin, Ill.
J. P. Baden Produce Co., Winfield, Kan.	Cedar Valley Creamery Co., Cedar Rapids, Ia.	Oakdale Dairy, Fort Dodge, Ia.
Townsend Creamery Company, Portland, Ore.	Mason City Cream Co., Mason City, Ia.	

Many of the above institutions were users of other makes of power machines—all of them were most vigorously canvassed by other manufacturers—all of them have heard the stereotyped story of "ten times as many machines in use as all other makes combined," and about "protecting patents" which have expired and which no one wants to use. They have been bull-dozed and have listened to threats that "another creamery would be started across the road;" they have been offered antiquated, complicated, "patent protected" separators at as low and lower prices than they are now paying for the Empire, but they chose the Empire on a merit basis alone after a thorough investigation. Look up these companies who handle the Empire. They are clean, reputable business men. Many of them are selling from 200 to 400 separators per month. In the state of Kansas alone more than two thousand Empires were placed during the past year. The volume of business done by creameries using the Empire separators is double that of the aggregate business done by any competing machine through like channels. Investigate this statement. The Empire Separators are now being manufactured at the rate of 100 per day and still the demand is not being fully supplied. The reason is simply this:

When an Empire Separator is placed in a community, a dozen always follow it.

It is a machine that sells itself. It is so much simpler in construction, so much more easily operated; so much more easily cleaned; and gives so much less trouble that most farmers say it is worth twice as much as any other separator they ever saw. Don't be misled. Investigate for yourself. Examine the Empire, its work and its record, and then if you don't decide that it's the best separator in existence we'll not have another word to say. We want you to satisfy yourself **before you buy.** We'll guarantee the Empire will keep you satisfied after you buy. : : : : : : : : : :

EMPIRE CREAM SEPARATOR COMPANY,

Bloomfield, New Jersey. **Chicago, Illinois.**

The Empire has more late improvements and labor saving conveniences, covered by late patents, than any other separator made. That's why it keeps so far in the lead.

HOOD FARM
Abortion Treatment

Hood Farm Abortion Cure is proving the most successful remedy for this very prevalent trouble that we have yet seen.

After Abortion cows should be injected with Hood Farm Antiseptic Breeding Powder, which thoroughly disinfects, kills all germs and **makes cows breed.** Also successful where cows fail to clean and where they do not come in season regularly.

Hood Farm Abortion Cure, dollar size, prepaid to any railroad express point in the U. S., $1.25; $2.50 size, containing four times this quantity, $2.75.

Dollar size Breeding Powder, by mail $1.15; $2.50 size prepaid for $2.75.

Hood Farm Flexible Injection Tube, for administering the Powder, 75 cents; by mail, 90 cents. Address

THE HOMER YOUNG CO. Ltd. (Makers) Toledo, O

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Cow Pox.

I have a cow that is troubled considerably with sore teats and udder. Almost daily her teats and lower part of udder break out with little white pimples and the following day make sores.

Oakwoods, Tex. J. F. B.

Wash the teats clean with soap and water after each milking and when dry apply unguentum iodum until relieved.

Abscess.

I have a cow that became lame in front; legs are very lame and one is swollen and on top of shoulder blades there are two large swellings, large as my wrist, oblong shape and soft as if there was matter in them; one of her hind legs is lame now too.

Waddington, N. Y. J. A.

The swellings appear to be abscesses, the cause of which are unknown to us. They must be opened freely with a sharp knife and the cavity washed with tincture of iodine, full strength. After this keep clean with castile soap and warm water daily until entirely closed up.

Is the Heifer with Calf?

I have a heifer, two years old next September, that was served last December, and to all appearances was with calf, as she did not come in heat for about 3 months. In February she came in heat again and has been regularly since. In March she was again served, but is again in heat now. Is the heifer with calf from the first service, or is there something wrong? J. O.

Montague, Mich.

It is possible that your heifer is with calf and is still coming in heat, but we believe it more likely that she has been with calf and has aborted, and is now failing to conceive because of the unnatural conditions attending abortion. We would advise you not to breed her for several months, when a change of bulls may prove beneficial.

Warranted to give satisfaction.

GOMBAULT'S CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

Every bottle of **Caustic Balsam** sold is Warranted to give satisfaction. Price **$1.50** per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

"SAVE-THE-HORSE"

— TRADE MARK —

SPAVIN CURE.

POSITIVELY AND PERMANENTLY CURES

Bone or Bog Spavin, Ringbone (except Low Ringbone) Curb, Thoroughpin, Splint, Capped Hock, Shoe Boil, Wind Puff, Weak or Strained Tendons or Lameness.

FROM A REPUTABLE AND NOTED TRAINER

GLENVILLE DRIVING PARK, CLEVELAND, OHIO.

For the enclosed $5.00 please send me one more bottle of "Save-the-Horse." **It is doing great work.** Respectfully, MILLARD F. SANDERS.

HARTLAND, LIVINGSTON CO., MICH.

Find enclosed money order for $5.00, for which send me another bottle of "Save-the-Horse" spavin cure as it has done all you claim for it for me With the bottle I bought of you I took off a curb, spavin, and a side bone on a 3 year old mare that other spavin cures refused to help in the least. I consider your spavin cure the best on the market. E. M. PARSHALL.

HOWICK, QUEBEC.

I had a mare suffering from a bone spavin and very lame. I concluded to try a bottle of "Save-the-Horse" and at the expiration of six week's treatment she was free from all lameness and I consider it one of the greatest compounds made. DAVID BARRINGTON.

EDGEWATER, N. J.

Enclosed find check for $5.00 for which you will kindly send me by Wells-Fargo Express one bottle of "Save-the-Horse" as soon as possible. The horse I have been treating with "Save-the-Horse" went sound and I sold him. The last I heard from this horse he was still going sound and working every day, and I think he will stay sound. The bottle I am ordering now I will use on another horse that has a pair of spavins and a curb; he does not go very lame, but walks on his toes and I think "Save-the-Horse" will bring him around so that he will walk all right. Very truly, OTTO MEYER.

The fire iron is uncertain and invariably only aggravates the disease or injury; blistering is less effective than the fire iron, and both necessitates laying up the horse from four weeks to two months. Arsenic, mercurial and poisonous compounds produce irreparable injury

"Save-the-Horse" eliminates all these factors. Horse can be worked continuously. Cures without scars, blemish, or loss of hair.

It can be applied at any time, anywhere, any place, and in all conditions and extremes of weather—hot or cold. And no matter what the age, condition or development of the case or previous failures in treating, the concentrated penetrating, absorbing power of this remedy is unfailing.

$5.00 PER BOTTLE.

Written guarantee with every bottle constructed solely to satisfy and protect you fully. Need of second bottle is almost improbable, except in rarest of cases. Copy of guarantee sent upon application.

IF YOU HAVE A CASE DIFFERENT FROM INSERTED IN OUR BOOKLET OR ADVERTISING WRITE US.

We will advise you frankly as to the possibility of the remedy effecting a cure. Give explicit particulars, give the veterinary's diagnosis, if he is competent—inform us fully as to the age, development, location of swellings, lameness, action and previous treatment.

$5.00, all druggists and dealers, or sent express prepaid.

TROY CHEMICAL CO., TROY, N. Y.

BLACKLEGOIDS

BEST PREVENTIVE OF BLACKLEG.

Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each **Blacklegoid** (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. **Blacklegoids** are sold by druggists; *ask for them.*

Our newly printed eight-page folder on the "Cause and Nature of Blackleg" is of interest to stockmen. Write for it; it is free.

What Prof. Carlyle, University of Wisconsin, Says About Zenoleum Dip:

"It gives me much pleasure to state that we have used Zenoleum as a disinfectant in various ways about our live stock barns and stables, and have found it very satisfactory indeed for this purpose. We have used it as a sheep, cattle and swine dip, and have found it an excellent remedy for parasites of various kinds. I can recommend its use to stockmen generally for the purpose mentioned." PROF. W. L. CARLYLE, Madison, Wis.

Send for copies of **"Zenoleum Veterinary Advisor"** and **"Piggie's Troubles"** and see what others say about it. Books mailed free. Sample gallon of Zenoleum $1.50, express prepaid. Five gallons $6.25, freight prepaid.

"The Great Coal Tar Carbolic Dip." **ZENNER DISINFECTANT CO., 34 BATES STREET, DETROIT, MICHIGAN.**

Butter for the United States Navy.

The Continental Creamery Company Gets a Big Navy Contract.

The Continental Creamery Company of Topeka, Kansas, has again landed an immense contract for butter to be furnished to the Navy Department this summer.

This contract is for 400,000 pounds at a price of 28 cents per pound, aggregating the value of $112,000. When the Continental Creamery Company received the order last summer for 250,000 pounds, it was the largest order ever filled by any concern in the country from its own product, and was the first time any such contract had ever been considered by any Kansas firm. The order for the Brooklyn Navy Yard, this year however, is 150,000 pounds greater than the order filled last year and must be delivered by July 15th.

The specifications which are to be filled on this butter are interesting. It is to be packed in tins of three pounds weight, hermetically sealed. The tins are then wrapped in blue paper, packed in sawdust, thirty in a box of special make and iron bound. Special machinery has been installed to handle the packing, every pound of which will be made and packed at the Topeka plant. The butter will be under refrigeration at all times and will be sent in two train loads of ten cars each to the Brooklyn Navy Yard, where it will be used in the Commissary Department of the Navy to supply all Atlantic vessels. The Continental Creamery Company must fill this order by the 15th of July and yet keep up the supply for their regular business.

A separate contract is required for furnishing the Pacific vessels of the Navy and this will be filled by a separate contract to be delivered at the San Francisco Navy Yard. This contract has not as yet been let.

We manufacture the Wringers that wring the Clothes of the World

THE "1900" FAMILY WASHER FREE.

Greatest Invention of the Age. Labor and Expense of Washing Clothes Cut in Two.

No More Stooping, Rubbing or Boiling of Clothes.

Every Household Needs One.

THE "1900" BALL-BEARING FAMILY WASHER SENT FREE

to anyone answering this advertisement, without deposit or advance payment of any kind, freight paid, on 30 days trial. The 1900 Ball-Bearing Washer is unquestionably the greatest labor saving machine ever invented for family use. **Entirely new principal.** It is simplicity itself. There are no wheels, paddles, rockers, cranks or complicated machinery. It revolves on **bicycle ball-bearings,** making it by far the easiest running washer on the market. No strength required, a child can operate it.

No more stooping, rubbing, boiling of clothes. Hot water and soap all that is needed. It will wash **large quantities of clothes** (no matter how soiled) **perfectly clean in 6 minutes.** Impossible to injure the most delicate fabrics. As the Sup't. of the Savannah Yacht Club says:

"It is a wonder. Our washing is very large and "we have always had two women on Monday and one "on Tuesday. Our cook and the yard boy **now do** *"the washing in 4 hours much better than before."*

NEWMAN, Ills, July 5, 1900.

I can testify that the 1900 is the best washer and the easiest running machine. It will **absolutely clean** the clothes, cuffs, and bottoms of ladies white skirts better than can be done by hand. The washings that took my wife from 5 to 7 hours to put out by hand, can easily be done in two hours. R. A. SKINNER.

KENSEE, Ky., March 21, 1900.

I did a double washing for myself yesterday and made 65 cts. from my boarders, besides all my cooking, milking and housework. It takes less soap with your machine than in the old way. I have no need of the washboard any more. Mrs. L. A. BARTON.

ONALASKA, WIS., Jan. 4, 1901.

We are a family of 5 and as I had a 3 weeks wash it was an immense one. Had it all out in 3 hours and never had nicer looking cloths. I did not even put my hands into the water. I cannot too strongly recommend the "1900" washer.

Mrs. J. M. WILSON.

HEART OF CALIFORNIA

Alfalfa a specialty. Creameries on the Estate. Ample Railroad Facilities.
Land Sold on Easy Terms in Small or Large Lots.

WRITE THE MANAGERS

404 GREAT NORTHERN BUILDING.....CHICAGO.

A Red River Valley SNAP!

1356 acres on banks of the Red River, east of Grafton, Walsh Co., the banner county of N. Dak. Fine land, 1100 acres cultivated, 50 acres timber, balance pasture. Good buildings—2 houses, barns, work shop and out buildings. Granary for 27,000 bushels. This cannot be beaten at the price, $28. per acre. Reasonable terms. Improved and unimproved, large and small tracts for sale in Grand Forks, Walsh and La Moure Co. N. Dak.; Marshall, Kittson, Lyon Cos., Minn. and Washburn Co., Wis.

BURCHARD-HULBURT INVESTMENT CO., Manhattan Bldg., ST. PAUL, MINN.

Buy You a Ticket to CROOKSTON, MINN., and call upon
The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2¼ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160, acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

OUT THEY GO

The crowds are going to **Morton County, North Dak.** ota; rich black soil, clay subsoil, producing heavy crops—where **corn grows.** Excellent water, 10 to 30 feet deep. **Coal is Free.** Stock feeding only about six weeks in the year. **Our Creamery** butter brings Elgin prices. We own 175,000 acres and sell farm lands for $7 to $12 per acre; grazing lands $4 to $7. **Free Homestead** lands adjoining. 9,000 people now in County. Healthiest climate. **Write for facts and maps.**

Directions for the Treatment of an Aborting Herd.

1. Burn aborted foetuses and membranes: This material carries the gems of abortion in abundance and burning or deep burial furnish the only means of getting rid of it in a safe way.

2. Isolate discharging cows: The vaginal discharge from cows that have aborted is very virulent and may furnish the means of infecting other cows. Hence, discharging cows should be kept apart from the herd.

3. Disinfect the premises: This procedure should be executed with the most exacting care. Partial or inefficient disinfection is practically useless. To disinfect, where fumigating with the vapor of formaldehyde cannot be employed, the spray pump furnishes the best means. It should be born in mind that disinfectants do not destroy germs that they do not come in contact with. So, all large accumulations of bedding, forage and manure should be removed and every place that may harbor a germ should be reached with the disinfectant. Especial care should be used to drive it into every crack, knothole, behind every loose board, on top of every beam and into every partly concealed hole, as well as upon every exposed surface.

A 5 per cent of good (not crude) carbolic acid may be used for this purpose.

Following the disinfection by spraying and the cleaning of the stable, it may be whitewashed with lime, wash containing one pound of fresh chloride of lime to each 3 gallons of water. This may be applied with a brush or, better, with a spray pump.

The barn yard should be well cleaned out, the manure being spread in some field that the cattle do not have access to. The bottom of the yard should be well scraped and the earth stained with leachings from manure should be removed. Then the surface of the yard may be flushed with a saturated solution of sulphate of iron or thickly spread with lime. The outer wall of the barn, facing on the yard, and the adjoining fences, should be disinfected or whitewashed.

4. Irrigate the genital passages of the cows that have aborted: The purpose of this procedure is to disinfect the genital passages. A convenient method is as follows: Hang a bucket containing the antiseptic solution back of the cow. To a spigot on the side of this bucket attach a rubber hose ⅝ inch in diameter and about 6 feet long. Insert the hose into the vagina and, if possible into the uterus of the cow. Allow from 2 to 3 quarts of the warm solution to flow into the cow and out. Take a fresh hose and irrigate the next cow, allowing the first hose used to soak in an antiseptic solution in the meantime.

This treatmeut should be repeated every second or third day so long as there is any discharge from the cow. Afterwards it may be used once or twice a week. As appropriate solutions, the following are recommended: Lysol, 1%; creolin, 2%; bichloride of mercury, 1-3000; carbolic acid, 1½%; boracic acid, 3%; permanganate of potash 1%; alum, 1%; chloride of zinc, 2%. The last injection, two days before service, should be bicarbonate of soda, 2%.

5. Irrigate the sheath of the bull. The purpose of flushing out and disinfecting the sheath and the outside of the penis of the bull, is to prevent him from carrying the germs of abortion from one cow to another. This procedure should be enforced *before and after each* service. This is very important. The sheath may be flushed out by using a small rubber hose and funnel. The end of this hose is to be inserted into the sheath beside the penis, the fore-skin is held together with the fingers and the antiseptic is poured into the funnel. A 1% solution of lysol is good for this purpose.

6. The long hair at the end of the bull's sheath should be cut off: Moreover, it is well to clip the hair from under the belly over a circle one foot in diameter surrounding the opening of the sheath. Then, by washing with a sponge this area can easily be cleaned before each service.

7. Wash off the external genitals of each cow every day: For this purpose use any of the antiseptics recommended above. They can be applied with a clean sponge. The parts washed should comprise the root of the tail, the anus, the vulva and the surrounding skin for a distance of several inches, and the corresponding portion of the tail. A separate bucket and sponge should be used for the cows that are pregnant and those that have recently aborted.

8. Do not breed a cow for ten weeks after she has aborted: About ten weeks are required for the thorough treatment of a cow that has aborted and she should not be bred before the expiration of this period. If she shows any discharge or other indication of vaginal catarrh she should not be bred for a longer period, or until the parts are in entire normal condition.

9. A solution of carbolic acid may be administered subcutaneously to each pregnant cow: For this purpose use a a 3% solution of carbolic acid and of this inject two drachms every ten days. Should this cause swelling in some individuals, for these use a smaller amount.

10. Remove cows from the herd before they abort, if possible: The purpose of this is to prevent the re-infection of the premises. Of course, this cannot always be done and when a cow aborts in the cow stable, thorough disinfection is again required.

11. Repeat the disinfection of the stable from time to time and pay particular attention to the cleansing and disinfecting the gutters. For frequent flushing of the gutters use a saturated solution of sulphate of iron.

12. Treat the cows according to their individual needs. If a laxative or tonic is needed give Epsom salts, or iron or arsenic according to the indications.

13. Whenever possible it is well to use a separate bull for the cows that have aborted and another for the sound cows. But even in this case it is important to observe the precautions cited under heading No. 5—using a separate apparatus for each bull.

PENNSYLVANIA LIVE STOCK SANITARY BOARD.

That List of Questions Regarding Abortion.

ED. HOARD'S DAIRYMAN:—If one of my neighbors knew everything, I would like to consult him frequently. Having no such neighbor, I printed 1,000 lists of the questions you published in regard to abortion and by gathering the facts known by each farmer who answered, I hoped to learn much more than I could learn from any one man.

Some farmers think abortion is usually contagious. Others think it is not, but

If Stands Alone.

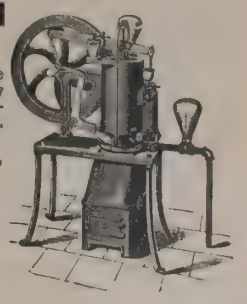
Doctor Pierce's Favorite Prescription stands alone, as the one and only remedy for leucorrhea, female weakness, prolapsus, or falling of the womb, so absolutely specific and sure in curing these common ailments of women, as to warrant its makers in offering to pay, as they hereby do, the sum of $500 reward for a case of the above maladies which they can not cure. This is a remarkable offer. No other medicine for the cure of woman's peculiar ailments is backed by such a remarkable guarantee. No other medicine for woman's ills is possessed of the unparalleled curative properties that would warrant its makers in publishing such an offer; no other remedy has such a record of a third of a century of cures on which to base such a remarkable offer.

Miss Emma Weller, who is Secretary of the Young People's Christian Association, at 1818 Madison Avenue, New York City, says: "Your 'Favorite Prescription' is a boon to sick and tired women, for it cures them when other medicines fail. I know whereof I speak, for I have had experience with it. For fourteen months I had constant headaches; seemed too weak to perform my daily duties, and when the day was over I was too tired to sleep well. I suffered from nervousness and indigestion, and everything I ate distressed me. Doctored with different physicians but received no relief. After reading one of your books I decided to give your 'Favorite Prescription' a trial. Am very glad I did, for I found it was just what I wanted. I commenced to improve at once and kept getting better until, after seven weeks, I was entirely cured. I have remained in perfect health ever since, and remain a firm friend of your 'Favorite Prescription.'"

The dealer who offers a substitute for "Favorite Prescription" is only seeking to make the little more profit afforded by a less meritorious medicine. His profit is your loss. Therefore, turn your back on him as unworthy of your patronage.

If constipated use Dr. Pierce's Pleasant Pellets. They cure constipation, biliousness and sick headache. They do not produce the "pill habit."

WORLD'S DISPENSARY MEDICAL ASSOCIATION, Proprietors, Buffalo, N. Y.



HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

Careful Farmers

—careless ones will not be interested—should keep a barrel of Conserve on hand all the time. It will prolong the life of every stick of lumber on the place, and save dollars for every penny that it costs. Two cents' worth will make a fence post last years longer; five cents' worth will protect a sill, etc. It sinks into the wood, and prevents wet or dry rot. A scientific money saver. Send for our circular; it will pay you to investigate

Conservo Wood Preservative.

SAMUEL CABOT, Manufacturing Chemist, 80 Kilby Street, Boston, Mass.

we must look for a cause with which infection has nothing to do. I belong to the latter class. There are undoubtedly localities where it is contagious and one herd may take the disease from another, but from the answers received from all parts of the United States, I can safely express the opinion that not more than one herd in ten from those reported, has contagious abortion, but there is another cause the same as there is a cause for a cows retaining the after-birth. If one cow every week for eight weeks retains the placenta, nobody thinks it occurs on account of a contagious disease in the herd, but the first cow was improperly fed and the other seven were fed the same way.

I spent twenty-five years on a farm in Vermont and during that time I never heard of a single case of abortion. I have now spent fifteen years inquiring: "In what respects do the conditions at the present time differ from those upon our old farm?" If we put two barrels of apples of the same kind in different cellars and in three months, we find the apples in one barrel sound and the apples in the other barrel half decayed, we at once begin to inquire the cause of decay. If we find the first barrel was kept near the freezing point while the other was in a temperature of 60°, we will hereafter keep our apples in a cool cellar. So in the case of abortion, if we can ascertain the cause, or the different causes, if there is more than one, we can hope to avoid the causes and avoid the disease.

Five years ago I published six causes of abortion as I had found them, while taking care of my own herd. That I was not beating the air nor following a phantom, is proved by the fact that after learning those causes, there was not a single case of abortion in my herd for eight years, excepting one that had formed the the habit of dropping her calf prematurely, and then I saw a cow put her horns under the belly of another cow in front of the bag. That same cow has since carried two calves full time.

While I have been looking for light, I do not put that light under a bushel, but proceed to give a few more causes:

1. One man reports that his herd was nearly ruined by abortion and one of his neighbors told him the trouble was caused by small worms. He would not believe it, but finally killed a cow, and found the worms, but said the mischief was caused by the worm's cutting off the navel cord and killing the calf. He used carbolic acid without effect, but afterwards found something which he injected and cured his cows and he had no trouble for several years.

2. From Australia comes the report of killing cows that had aborted, and finding the ovaries diseased.

2. Cotton seed meal seems to be the cause of much of the trouble in the southern states. This is a cheap feed where it is raised and often fed to excess. I would not feed it during the last six months of pregnancy nor to a cow constantly coming in heat.

4. Pressure upon the calf. In almost every pasture in Vermont is a running stream of water. In many pastures of the west, this is not the case, and if cows are not watered at noon, they will drink a large quantity when driven home at night. Some cows fill themselves very full of grass, and the water, which is often followed by a liberal feed of meal, must make an intense pressure in all directions. Keeping up this pressure day after day must weaken and may finally kill the calf.

A quantity of bedding may be rolled up in such a way that half the weight of the cow will rest upon the calf all night. In Vermont, we raised little grain and used little bedding. The stable door should be six feet wide, or two cows may be jammed into a narrow door in such a way as to injure the calf.

5. Allowing a cow in heat to run in the pasture. Certain cows may follow her all day.

6. Going back once more to Vermont, I will state that we never had a drop of more than two inches behind the cows. Many of the farmers report a drop of six or eight inches. Who knows but that the cow or calf may be injured by the cow's frequent slipping with both hind feet into the gutter.

7. Several cases of abortion have been reported when cows were running on marsh pasture. Feed a calf a pint of milk a day and he will soon starve. A calf may die from starvation before birth as well as after. The cause of abortion may be insufficient nourishment of the foetus, or it may be some weed. One man reports that aborting cows sold to his neighbors were all right afterwards. Possibly they had no marsh in the new pasture. N. B. WHITE.

Oconomowoc, Wis.

He Succeeded in Getting the Milk.

ED. HOARD'S DAIRYMAN:—As I wrote you a few months ago for a balanced ration for my cows, as I told you in my last letter I was a young farmer, commenced farming only last April, 1902, now I want to tell you what that picked-up herd of nine cows has done since April 17, 1902, to April 18, 1903. Now, I have never weighed any of their milk or had any tested for butter fat, which I know is wrong, but intend to as soon as circumstances will permit. I have churned from my nine cows 3,109 lbs. butter, not butter fat, but actual churned butter; now I think that is pretty good for a green hand.

Now as I said I was no farmer, but an experienced butter maker, having run a creamery four years prior to last April, so I think I know how to get all the butter out of the cream, and now I will tell you how I got all the milk out of the cows. I subscribed for HOARD'S DAIRYMAN, and I not only read it, but I studied it, so I knew it almost by heart; so with the knowledge I had of getting the butter, your valuable paper taught me how to get the milk.

Lots of people can make a better record than this, yet there are people that don't do half as well right in my own neighborhood, and have kept cows and lived on a farm all their life. I have tried my best to get some of my neighbors to subscribe for your paper, but they say they don't believe in balanced rations and book farming, but there are lots that do, and by reading your paper prove it.

I am going to try and improve this year. I am building me a new barn 32×44 feet, with all the light I can possibly get in it; basement arranged for twenty-six head of cattle; will have three box stalls, cement floors and gutters, the King system for ventilating, water in barn, and a round silo 16×30 feet; so I think I will do better this year than last. Will write you again next April and give you my success or failure, whichever the case may be. EDWARD BOUGHM.

S. Hoxie,
Supt. of Advanced Registry.

Yorkville, N. Y., March 14, 1903.

Official Guernsey Records.

The work of the Advanced Register of Guernsey cattle has been most successful. It is based on yearly records of milk and butter fat and is the first Register of the kind to adopt that basis. It was authorized less than two years ago and has been well established only a little over a year. During this brief time the records of over one hundred animals have been or are being followed. Of these 37 have been admitted with official records, varying as follows:—Milk from 5471 lbs (by a 2-year-old) to 12187 lbs. Butter fat from 296.9 lbs. (by a 2-year-old) to 602.4 lbs., (equivalent to 346 and 702.8 lbs. butter.)

Only three 7 day records have been made. They are 11.80 lbs. butterfat by a two-year-old and 16.22 lbs. butter fat (equivalent to 13.77 lbs. and 18.67 lbs. and 18.92 lbs butter.) Four bulls have been admitted by having two or more daughters in the Register. Eight of these records have just been completed and are:

Ella Elvira of Perry 14595, owned by Stephen Walker of Buffalo, N. Y. 5471 lbs. milk, 296.99 lbs. butter fat. (2-year-old)

Camissa 11437, owned by Jas. Logan Fisher, Philadelphia, 7625.76, lbs. milk, 298.91 lbs. butfat.

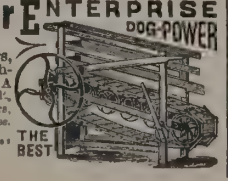
Fernwod of Chantilly 11886, owned by Mr S. M. Shoemaker, Stevenson, Md., 7782.66 lbs. milk, 327.08 lbs. butter fat.

Zelma 13051, owned by Mr. G. B. Tallsman, Perry, N. Y. 6068.2 lbs. milk, 340.34lbs. butter fat.

Lofty's Isabella 7922, owned by Mr. G. B. Tallman, Perry, N. Y. 8537.5 lbs milk, 368.57 lbs. butter fat.

Yolande W. 14374, owned by Mr. G. B. Tallman, Perry, N. Y., 8200.2 lbs. milk, 369.17 lbs., butter fat.

Cecchina 11694, owned by Mr. F Lothrop Ames, Boston, Mass., 7576 71 lbs. milk, 398.58 lbs. butter fat.



Lady Blanch of Ashland 12664, owned by Mr. G. B. Tallman, Perry, N. Y. 9317.7 lbs. milk, 407.5 lbs. butter fat

Lofty's Margaret 7924, owned by M. G. B. Tallman, Perry, N. Y. 7567 lbs. milk, 416.82 lbs. butter fat.

Wm. H. Caldwell, Secr'y.

Peterboro, N H.

A Labor Saver In the Dairy, for running separators, churns, etc. Will run washing machine, as well. A dog, sheep or goat will operate it. Also horse powers, tread powers, silos, etc. *Catalogue mailed free.*

HARDER MANUFACTURING CO., COBLESKILL, N. Y. THE BEST

$5.00 FROM OUR OWN FACTORY BUGGY Offer Most Liberal Proposition Ever Made!

"XX FLYER"

$38.50 F. O. B. CHICAGO

Built to Your Order With Your Monogram on Seat Riser

"The buggy has arrived. We consider it a bargain, saving us at least $25.00 in price." — E. J. Phillips & Bros., Round Mountain, California.

1000 sold since April 1st. — Remember it is ours if it does not please you.

YOUR BUGGY is built *exclusively for YOU.* We have a large stock of bodies, wheels, gears and shafts, all in lead and oil, ready to be finished *to your order* by the best mechanics the market affords. The price we quote is the cost of material, the labor of making and a small profit for our factory. Such opportunities are not offered every day.

YOU SEND $5.00 with your order and the balance 10 days before you want it shipped. It goes direct to you from our finishing rooms in all of its original beauty. **ILLUSTRATIONS, DESCRIPTION** and full information with *Free Vehicle Catalogue* sent upon request. Send postal today. An unusual offer. Do not miss it.

World's Largest Vehicle Factory Selling Direct to Users

We Know What's Under the Paint — 500 Shipped a Week

Send for Vehicle Catalogue E10. An unequaled line of well-made and handsomely finished Buggies, Phaetons, Surreys, Runabouts, Carriages, Wagons, Carts, etc., at *Factory Prices.*

22.90 For our *"Diamond Special" Road Wagon* Solid panel spring back; padded seat sides; Pegamoid leather trimming; spring cushion; carpet; boot and shafts. *Over 300 sold during March.*

33.90 For *No. 1 "Big 4" Buggy.* Leather quarter top; solid panel back; best quality elliptic springs; green cloth trimming; all hickory wheels; springs in cushion and back; side curtains; boot; storm apron; wrench; shafts and anti-rattlers.

35.75 For our *"Leader" 3-Spring Wagon.* 1 1-16 axles; double reaches well ironed; iron hub, all hickory wheels; spring cushions; Pegamoid leather trimming; nicely finished. *A mighty good wagon at a mighty low price.*

38.50 For *Young Man's Fancy Buggy.* A general favorite. The price is less than your dealer pays for such in car lots. Long distance axles: selected hickory wheels; genuine leather quarter top; trimmed in fancy velour; side panel of body painted a dark maroon. A beautiful job in every way.

42.50 For our *"Brown Beauty" Buggy.* One of the *choicest* in the line. Brown panels on body; brown cloth trimming; brown head lining; red gear; long distance axle; new style upholstering. *A nobby rig at a low price.*

44.90 For our *"New Thorneward" Buggy.* More of this style sold than any other. Long distance axles; Bailey loops; all-wool cloth trimming; elegant finish. *You could not duplicate it from your dealer for $65.00.*

46.50 For our *"Lakeside" Triple-Service Surrey.* A large, roomy, full panel back, spring cushioned surrey which can be used also as an open driver or one seat wagon with room behind for trunks, etc. *All for the price of a buggy elsewhere.*

69.85 For our *"Peerless" Buggy.* The pride of our factory. Has all the essential features of the very highest grade work. Usually sells for $25.00 more than price quoted. *You will be proud of it anywhere.*

We Allow No One to Undersell Us—Quality for Quality

The vital point in a purchase is not entirely WHAT YOU PAY, but WHAT YOU GET for your money. Remember we guarantee to absolutely satisfy you or we will refund the purchase price, and pay the freight both ways.

IN DAYS OF OLD

In days of old men fought in armor bright,
And crops neglected died of winter's blight.
In modern days men sow and reap the grain, and

DEERING BINDERS

Help to make their gain.

Your Dairy

May be kept ever so clean, your cattle may be pedigree stock and you may feed them in the most approved manner, but your patrons will never suspect these things if you deliver milk from a ramshackle wagon. An attractive milk wagon attracts trade; it's not a luxury, but a practical necessity.

The Koenig & Luhrs wagons are built for the business. They embody every convenience, are handsome in finish and general appearance, are made of good materials and are so well put together that they'll last for years. A quarter of a century's practical experience has taught us the "know how" of good wagon building. Are you considering a new wagon? It will pay you to get our catalog and prices before placing your order.

The Dairy Bred Steer.

ED. HOARD'S DAIRYMAN:—The question of raising calves has, to a large extent, been settled by the work of our experiment stations and the general use of hand separators, but what are we to do with the dairy-bred steer after we have raised him is still an open question, which is being answered on our dairy farms in a great number of ways. Some say, kill them at birth and you will save money, and although this is a greatly exaggerated statement, still it shows at what value the dairy steer is held by many.

The idea which is very generally prevalent, that the dairy steer is of little or no value, has been a strong factor in keeping men from entering the dairy business and has greatly increased the demand for the so-called dual-purpose cattle. Not speaking from my own experience, but from the experience of others, I believe that with proper handling and feeding and a little skill in marketing, the dairy steer may be turned into a profitable piece of property.

It might be well in the first place to state some of the objections which buyers offer. The packers and butchers argue that the meat is of an inferior quality. This is true to a certain extent, as it has less of the intermixing of fat and lean, or in other words, the meat is not so well "marbled." Granting that this is true, still the difference between the two classes of meat is greatly exaggerated. Prof. T. L. Haecker of the Minnesota Experiment Station says that for the production of baby beef there is little difference, if any, between the dairy steer and the beef steer, and his statement is backed up by numerous block tests and years of experimenting with dairy cattle.

The feeder says he don't want a steer that has dairy blood in him because he is slow maturing and expensive to feed. Every experiment has shown that there is no difference in the early maturity of the different classes of steers and that it cost but little more, if any, to put a pound of meat on the back of the dairy steer than on the back of the beef steer. This statement is rather hard for many to believe, especially the beef raisers, but it is nevertheless the result of a great many experiments along this line.

With these facts in mind, can one help but believe that the real difference between these two classes of steers is in the mind of the predjudiced buyer and not in the steers. With this the case the question arises, how can we market them profitably. The Nebraska Experiment Station is producing steers which promise to market well, by crossing their dairy cows on an Aberdeen-Angus bull. This, however, would be profitable only in a few cases, as both steers and heifers would have to be disposed of for beef.

The good dairy cow is a scarce article and must be made to produce good dairy cows even if one-half of the offspring are valueless. The other one-half, if superior dairy animals, will more than pay for what is lacking in the steers. But there is no reason why these steers can not be made profitable. They make good baby beef and if fitted for the market young a good profit should be realized. Of course it must be understood that the successful production of baby beef requires a thorough knowedge of the art of feeding and the fact that one has failed once or twice should not cause him to give up.

The greatest difficulty comes when you take them to the stock yards to sell. The price offered in nearly every case is far below the real value of the animal and this very often knocks off all the profits and makes one feel disgusted with the business. A far better way of disposing of them would be to contract with local butchers to furnish them with baby beef for their trade. This would not be practical in all cases, but where practical it could no doubt be managed so as to be profitable for both parties.

The experiments that are being carried on by some of the experiment stations, are doing much toward redeeming the dairy steer, and it is hoped more stations will take up the work. Meanwhile a discussion on this subject in the HOARD'S DAIRYMAN would be of great value to its readers, especially the young readers. What are the successful dairymen doing with their steer calves? Let us hear from them.

E. PAUL GOODYEAR.

Kansas.

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

ARMOUR'S BLOOD MEAL Cures Scours in Calves.

First proved by the Kansas Agricultural Experiment Station, and since corroborated by thousands of leading stockmen who have used it without a single failure. Equally effective for the diarrhea of all animals.

PREVENTS weak bones, paralysis of the hind legs and "thumps" in pigs; "big head" of foals; "rickets" of all young animals; abortion due to incomplete nutrition, and a host of other troubles.

A Potent Food for Work Horses, Dairy Cows, Poultry.

Write us for booklet giving valuable information about **Blood Meal** and our other feeding products. Consult us free of charge regarding stock diseases.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Includes postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office orExpress Order (never by personal check), addressing Hoard's Dairyman, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

Odds and Ends.

It would seem, considering the number of experimenters that have been prying into the internal arrangements of the cow during the past 50 years, that most of the why's and wherefore's of her being ought by this time to be reduced to figures and put on record. But when one begins to figure up things, we find to our surprise that there is a constantly increasing mass of facts and figures being poured into the assimilating mill to be ground fine and digested. We know many things regarding the cow; many things that she has done in the past, from which we might reasonably expect that she would do the same or like things in the future. But as the poet says:

"When she will, she will and you may depend on't,
And when she won't, she won't and there's an end on't,"

which wasn't written concerning the cow primarily, but is none the less pertinent and applicable in spite of protein, carbohydrates and professors.

When we ask the question, What does the cow do with her food? we find that we are wandering around on the outskirts of knowledge, in association with a few practical facts that have been produced by a "tripartate agreement" between the cow, the practical man and the professor, and we have as a result that some cows produce more milk than other cows on the same amount of food; that some cows produce more butter fat than other cows on the same amount of food, and the same is true of her maintenance food, the water she drinks, the calf she produces, and many other things in connection with her cowship.

There may come a time when the scientist will be able to cut a trap door of some kind through which he can view the workings of her machinery and tell us when, where, why and how it goes on, but at present what knowledge we do get is obtained by the hardest kind of cutting and fitting and the subject of it all placidly stands, chewing her cud and swishing her tail, and to all questions is as uncommunicative as an "allegory on the banks of the Nile."

The great question at present is: How much protein does a cow need and what does she do with it. For the past ten years the amount of protein needed by an animal of 1,000 pounds weight has been steadily decreased. It was 2.5 pounds; now,according to Prof. Haecker, it is in the neighborhood of 1.5 pounds for a 1,000 pound cow, and it may be lower. Wherein does the modern cow differ from the one that established the standard years ago? Is she a better machine? Do the wheels go around with less friction? Does it take less fuel to supply power? All of which questions are easy to ask, but difficult to answer. At all events it seems evident that there is a saving of nearly a pound of protein a day, and as protein is expensive the fact is of material value to the dairyman, even if the fact and the reason for it are not associates at present.

The smooth talker is still a power in the land and it is strange how little of actual value can be joined to a glib tongue to make the combination into a money maker. The above is suggested by the following letter: "I bought the following recipe from an agent, to keep cream sweet for three to five days, and I take the liberty to ask you if this recipe is right or against the law.

Sal Natro Hydrate	1 oz
Common salt	1 oz
Carbogen gas (solution)	
Filtered water	1 pint

Can you give me a better preservative Perhaps the purchaser of the above is not to blame for thinking the above is valuable and worth its price, whatever that may be. He is not the only man who has put his faith in a thing because it was expressed in words somewhat out of the common. So let us translate it as follows:

Bicarbonate of soda(saleratus)	1 oz
Common salt	1 oz

Dissolve in a pint of water and use *ad lib.*

It is safe to assume that if his neighbor had attempted to sell him a mixture of saleratus and salt, at a good price, for preserving cream, he would have wanted to "swat" him, but the combination of a well dressed stranger, a smooth talker, and unknown words did the business. Well, he is not the only sinner in this respect. The M. D.'s do most of us in the same way, and we don't even kick.

But coming back to the "preservative." The action of the salt is "nil;" there is not enough of it to be of any value. The saleratus unites with the lactic acid as fast as formed and so keeps the milk "sweet," but the bacteria keep on growing faster than they would if the soda were not present, and consequently the milk spoils with increased rapidity. As regards preservatives, the Dairyman has been against their use consistently and continuously, believing that their use is always for the worst. They merely enable the dairyman to keep up his dirty habits, to substitute antiseptics for cleanliness, and enable him to block all attempts towards producing milk of a better quality. "We're agin it."

How long should churning take? is always an interesting question to the dairyman who is turning the handle. And yet no one can say exactly, because so much depends on the churn, the cream and the cow, as well as ripening, temperature, feed and speed. But if the various conditions, as per above are average, and the churning is done between 56–58 degrees in summer and 60–62° in winter, the butter should gather in about 35 minutes and the time will swing on either side of this "according." If, however, the time runs over 40 to 45 minutes, the quality of the butter will suffer in proportion to the extra time.

Then there is usually a hit-and-miss, happy-go-lucky method in salting animals; usually because there is no sharp indication of neglect in this matter. Of course the anti-salt people will tell you that salt is not necessary; that such and such animals get along without it and the cow can do likewise. All of which may be so, but the cow is a creature of habit and when she has become accustomed to have salt in her ration, salt she must have, if she is expected to do her best work. Prof. A. P. Aitkins gives the following reasons why salt should be given to farm stock:

1. In the blood of animals there is six or seven times more sodium than potassium; therefore, in order to keep animals in good health a definite amount of common salt must be assimilated.

2. The addition of salt to animal food increases the appetite, promotes the repair of tissue by its searching diffusion through the body, and stimulates the rapid using up of its waste products. Boussingault's experiments showed that salt increases muscular vigor and activity, and improves their general appearance and condition.

Therefore give your stock salt regularly and in sufficient quantity. F. G. S.

GUERNSEY BULL, HEDWIG'S NONPAREIL, A. G. C. C., No. 6746,
Property of Hillside Farm, Greenville, Me.

A Pasture-al-Idyl.

"Yes," said he, looking across a broad acreage, "there is a pasture that was cleared 100 years ago. That is the original sod, for it, in all these years, has never been plowed, or a pound of applied fertility put upon it. The blue grass grows spontaneously upon it."

It was a pretty sight to look across the field to the woods. Not a bush, or foul weed was to be seen. Here and there a small symetrical elm for grateful shade, and a herd of cows, some grazing, some lying on the grass sward, and overhead the lazy October sun was throwing its mellowed rays over all.

"Yes," continued the farmer, "that's a grand pasture. Beyond the woods it is not near so good, but the fact is, I can winter these cows cheaper than I can summer them. An acre of good silage corn will give two cows winter pasture. Here on the average, my cows require four acres of summer pasture, and I have to both feed and soil to keep up the milk flow. Fine as that pasture is, I cannot depend upon it more than six weeks to keep up the milk yield, and then it is grain and something else to make the dairy profitable. Yes, a fine blue grass pasture is a fine thing; some feed, and lots of sentiment with it; but its got to be helped, if one is looking for a big milk record."

There was more than sentiment in his talk. It brought up the pasture question, and with it the problem of "what shall we feed the summer dairy."

What is the record in the matter? What about dairying anyway since 1850—the year the old white cow kicked me across the yard, for trying to trace with my finger the outlines of her escutcheon map. And, by the way, I have never believed in the theory since. Has the dairy industry as an art, and a commercial factor stood still? No, but the pasture has retrograded until the acres in the cow ranges will not carry one half of the stock they would fifty years ago. The pasture mentioned is a rare exception. The old pastures of the dairy farms are a neglected quantity, and the man told a great truth when he said that his summer pasture was more expensive than his winter one.

The inquiry to-day is, nine times out of ten, what can I best summer soil with; how about summer silos; and the tenth one is, how can I make my pasture as good as formerly. And why! Simply because the decline has been going on so slowly it has hardly been apparent until far apart years are compared, and then the falling off is noticed. And so gradual has the summer feeding of grain and other crops been introduced, it has come to be regarded as an inheritance and always a part of the dairy scheme.

It is not hard to see why this has come about in the process of the years. The hill pastures and vast amounts of the balance, have never been plowed, cultivated, or even fertilized in any way for three, four, and even five generations of owners. Year after year, the cows and young stock have roamed from April 1st to any time before Christmas over the pastures, and with a belief that sod land can, and does, exhibit a conservation of energy that is not looked for in any other farm crop, and that where the cattle run, the compensation is ample to maintain its fertility.

It may be that it is true, that on every acre there may be train loads of plant food in the soil, but years of cropping the grass, has in some way, taken up part, at least, of this store, and the amount of mineral matter taken away in the milk, and the growth of the stock, makes a vast sum in the years that are told, and each year makes the work of food collection by the grasses, so much more difficult, and at the same time invites in other guests—the weeds and the briers, those goats among plants—to occupy and crowd out the tame grasses. True, rain falls, and brings some nitrates, and the winter frosts, and the hoofs of the cattle break up the roots some, and the decay of old roots adds some humus, but a good, active, hungry cow will remove faster than the disintegrating forces of nature can supply. Then the drouths come, and the fierce, blazing sun burns out and dries out the grasses, and on these thin, semi-barren spots, the frost heaves out the few live grass roots as well as the dead ones, and the ready weeds come in to cover the nakedness of mother earth, with unsightly patches. The farmer says "the grass will crowd back in, in time," but the creeping vines, the moonshine, the poverty grass, the daisies and the big weeds galore, come in among the blue grass and the white clover, and one spear of grass now grows where two grew before. The farmer man sets down and writes to the editor man, "What shall I do? My pastures are undone, my hired man has struck for higher wages, and my son has gone to the city to carry a corn salve sign! How can I restore the pasture?"

This is true in the central west! A pasture once broken can never be made permanent again with a blue grass sod, like unto the old one. Once broken up, that land must go into rotation, and thus enlarges by so much the labor on the farm, that now is deplorably scarce, and and so adds to the dairyman's troubles. The solution is not easy. We attend conventions, and institutes, and talk about cows that must be made to give 15,000 pounds of milk per annum, and 600 lbs. of butter; of silos and the corn crop; of al-

falfa and the cold storage of cheese; and ask for laws that will make the feed sellers honest; and why the heathen rage. Little is said about the pasture, and how to maintain its fertility.

It may be that the summer silo is cheaper than pasture land, but so far the silo seems to be a make-shift to avoid resodding the thin grassed pasture. Can the pasture be ignored in the plan of dairying? Must it not be, and be an important factor in the economy of the dairy? An acre of silage may be cheaper than the grass on four acres, but in that event what will be the fate of the three acres of pasture yet remaining? A friend suggests that the solution is to plow up the pasture, fertilize it highly, and sow to alfalfa, and, when this is established, divide the pasture into fields, and rotate the cows every three weeks, and when they are turned into a fresh range mow the vacated lot, so as to make the alfalfa sucker, and send up fresh foliage instead of the stalks seeding, when the alfalfa will prove four times as abundant, will feed better than any blue grass sod possibly can, and the old, renovated pasture will be a very gold mine, where now only briers, daisies, and tall iron weeds grow.

This is hopeful, if we can only find this Mr. Productive Prosperity, at home, when we get there. Not a doubt exists but that the plow, added fertility, and other grasses than blue grass must be the solution of this pasture problem. On the hill lands, where it is difficult to plow, the problem is more complex, and no wonder some of those hill farms are selling very low. Why? Because paint-brush, brakes, and laurel, have crowded out the grass, and who shall or can rehabilitate these hills again with the rich abundant grasses? We do not write this from any pessimistic point of view that the day of doom has come, but to inquire how, and by what means can the old pasture be made to grow its old time luxuriant grasses? Who will answer? JOHN GOULD.

Ohio.

Elderbrook Dairy Notes.

An Ohio Herd Record.

ED. HOARD'S DAIRYMAN:—As some have sent yearly records of their dairies, I will send mine, beginning April 1st, 1902, and ending April 1st 1903.

Number.	Age 1902.	Lbs. Milk.	Value.	REMARKS. Calved.
1	9	6,065	$51.66	April 27, '02. Sold November '02
2	8	5,087	44 61	March 17, '02. Sold January '03
3	7	7,806	83.14	March 9, '02 and January 15, '03.
4	6	9,307	95.75	April 1, '02 and February 10, '03
5	8	5.633	49.10	March 24, '02. Sold January' 03
6	4	6,124	63.51	April 27, '02, due April 30, '03
7	3	6,372	76.87	July 7, '02, due October 1, '03.
8	2	4,822	64.76	September 1, '02, due Sept. 2, '03
9	2	6,237	62.67	April 7, '02, due August 18, '03
10	2	4.273	44.61	April 26, '02, due April 20, '03
		61,726	636.68	

As No. 2 and 5 would have been fresh in a few days, and No. 1 and 8 were milked only about 7 months, the average number of cows was not over nine. Milk was sent to the cheese factory from April 1st to December 1st, and the balance to Cleveland. City price was $1.65 per cwt. and factory price 80 cents to $1.20.

We have recently purchased a registered Holstein bull, whose sire's dam was America 2d's Pauline DeKol, the cow that won first prize at the Pan-American cattle show, for the most milk and butter in a seven day test. All the dairy ideas that I have, have been obtained by careful study of HOARD'S DAIRYMAN: Such as weighing each cow's milk twice daily, year around milk, grooming cows, spraying for flies, training heifers to be persistent milkers, feeding a balanced ration as near as possible, providing early soiling crops, feeding a little grain in the summer.

"An elastic standard", *i. e.*, we set 5,000 lbs. per cow, and beat it a little the first year, then changed to 6,000 lbs. and then beat it the year past.

We have dreams of an 8,000-lb. dairy some time, but expect that is a long time ahead. If a heifer does not give 4,000 lbs. the first year, some one else can board her. Have paid $172 for gluten feed and bran for the year. No other grain was fed except the corn in the silo. I think cows can be wintered for $2 per month, besides grain, by feeding silage and corn stover or straw, and pasture at $1.50 per month. This makes the cost of keeping $38.20.

Say, Mr. Editor, if every cow keeper had done as I have, what would be the price of gluten and bran? G. P.

Ohio.

WHY WE MENTION THESE THINGS.

Occasionally we get a letter from some subscriber in a distant state who can get no good out of the DAIRYMAN, and he will write us to stop it and will give as a reason, "your paper is not adapted to our section of the United States." Maybe the same mail will contain a letter from another subscriber from the same state who feels altogether different.

Here is the way a state of Washington man feels about it:

ED. HOARD'S DAIRYMAN:—Enclosed find P. O. money order to renew my subscription for your valuable paper. I only wish I had known of it 10 years ago. I would not like to lose a single copy.

R. C. MUELLER.

North Bend, Wash.

Now, this is not a selfish question with us. It is not one or one hundred subscribers more or less, that we speak of it.

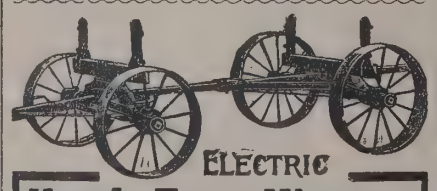
It is because we believe, mind and soul, in the work we are trying to do. It is because we believe that the great reason why so many farmers do not do better than they do with cows, is because they allow their minds, their thinking powers, their power of understanding, to get rusty. To keep their thought and judgment up to grade, they absolutely need constant reading on the dairy question. Progressive men think so. Are those men right; are they doing justice by themselves who don't think so? That is the real question at issue. That's the reason we speak of these things.

And here is a hard question to answer, one we have been puzzling over these many years. It is asked by an old reader of the DAIRYMAN and it is as follows:

Enclosed find $1.00 for which renew my subscription another year. Why don't more farmers try to read and take advice from such papers as HOARD'S DAIRYMAN? There would be better satisfaction and bigger profits at the cheese factory and creamery if they would do so. I have been a cheese maker, but am a farmer now. A. A. FOCHS.

Hilbert, Wis.

Here are two bits of testimony from German-American farmers, each living in states far distant from each other.



A GOOD WAY OF PUTTING IT.

In reply to a dual-purpose advocate who thinks farmers should go into the dairy business with this kind of cattle, Mr. N. A. Chisholm, of Jacinto, Calif., puts the question in the following shape in *Dairy* and *Produce Review*:

Well, G. L. P. does not understand the position of the "special-purpose advocates." They are not trying to put a stop to beef production, but only ask the creamery patron to place the special-purpose dairy cow and the dual-purpose cow side by side, feed both all they will consume of a milk producing ration, keep an individual record of pounds of milk and the percentage of butter fat of each cow, and amount of feed consumed, and inside of a year we will have another "special-purpose cow advocate." All of the scrub dairymen—most of the dual-purpose ones—and fully 75 per cent of the special-purpose dairymen will say: "I haven't got the time to fool around weighing and testing a cow's milk." Well, if they are rich enough to be able not to keep individual records of their cows, they have money enough to retire and go into the Unite d States Senate.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

ELECTRIC

Handy Farm Wagons

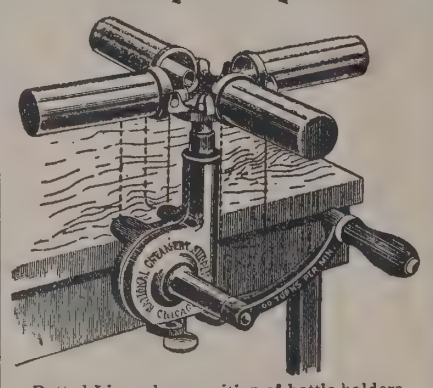
make the work easier for both the man and team. The tires being wide they do not cut into the ground; the labor of loading is reduced many times, because of the short lift. They are equipped with our famous Electric Steel Wheels, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. Guaranteed to carry 4000 lbs. Why not get started right by putting in one of these wagons. We make our steel wheels to fit any wagon. Write for the catalog. It is free.

ELECTRIC WHEEL CO., BOX 130, QUINCY, ILL.

Spring Medicine

There is no other season when good medicine is so much needed as in the Spring.

The blood is impure, weak and impoverished—a condition indicated by pimples and other eruptions on the face and body, by deficient vitality, loss of appetite, lack of strength, and want of animation.



Hood's Sarsaparilla and Pills

Make the blood pure, vigorous and rich, create appetite, give vitality, strength and animation, and cure all eruptions. Have the whole family begin to take them today.

Hood's Sarsaparilla promises to cure and keeps the promise.

NATIONAL

Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

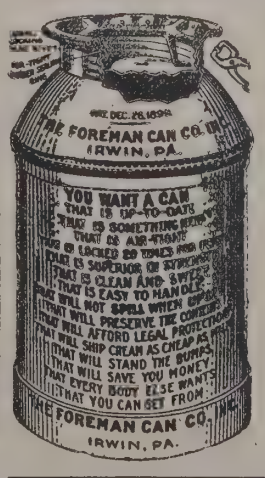
Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:



No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each..... 4 50
No. 4,—4 bottle, complete for testing cream and milk, each..... 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

We are the great Dairy Supply House of the West. We carry an immense stock of all kinds of Butter and Cheese Making Apparatus and Supplies. Write for catalogues and circulars.

National Creamery Supply Co.,

Pioneer—

One who goes before; a leader —Webster.

We are pioneers. Pioneers in the manufacture of pure vegetable parchmen paper. Like all pioneers, we have been followed by others. Most of them claim to make as good parchment paper as the "Paterson." We think that about the highest compliment that could be paid our

Pioneer Brand Parchment Paper.

Ours is the kind that taints nothing by contact. It is stronger when wet than when dry. It's absolutely unequaled for packing print dairy or creamery butter. It shuts out all destructive germs and vile odors and shuts in all the natural sweetness and flavor. It keeps butter longer and better than can be done by any other convenient means. It preserves the butter and your reputation as a butter maker at the same time. We print your name, dairy, creamery or private trade-mark and brand on every sheet. Write for sample sheets and booklets. Be sure to get our booklet, **"Better Butter."** We send it free.

The Paterson Parchment Paper Company,
No. 87 8th Street, Passaic, N. J.

THE PATERSON PARCHMENT PAPER CO. PASSAIC, N.J. PIONEER

Your Butter

is all right when it leaves your hands, but how about it when it has stood around the market or grocery a few days absorbing all kinds of odors? The only safeguard to your reputation is a perfect package.

Our New Gem Fibre Box

is the one perfect butter package. The border of this ad, which is a section of the box, shows how well it is made. Double and triple walls of impervious fibre; dovetailed walls and inner bottom; reinforced with extra bottom and lined throughout with parchment paper. Impervious to **moisture, holds the brine and will neither sweat, rust nor mildew.** Send to-day for free booklet and sample.

THE GEM FIBRE PACKAGE CO.,
Dept. E, Gem Building, Detroit, Mich.

Shepherd's Aerator

is most simple, most effective, least trouble. While you go on milking millions of air globules from the charged tank are passing up through the milk, driving out all animal heat and foreign odors. Works in shipping can. No other vessel to clean. **King among Aerators.** All dairymen prize it. Write for descriptive circular.

F. P. SHEPHERD & CO., Elgin, Ill.

A Powell County, Montana, Dairy Record.

ED. HOARD'S DAIRYMAN:—The following is our dairy record for 1902, as taken from our books. The average number of cows milked was 26; the amount of milk produced being 182,295 pounds. This makes an average of 7,011 pounds per cow. The largest amount given by any one cow—a three-fourths Holstein—was 10,715 pounds. Six other cows averaged over 9,000 pounds each. The cash sales of the dairy product, together with that used on the farm, follow:

2,920 pounds butter sold retail	$826 60
2,597 pounds butter sold wholesale	653.64
339 pounds butter used on farm	84.75
5,856 Total number pounds made.	
Bottled cream sold at wholesale	$144.90
Bottled cream so'd at retail	95.70
Bulk cream sold at wholesale	54.80
Butter milk sold	30.40
Whole milk sold	16.05
Skim milk sold	2.05
17 veal calves sold	145.41
4 calves raised valued at $5	20.00
168,779 pounds skim milk fed on farm at 15 cents per 100 pounds	253.16
547 gallons whole milk used on farm	109.40
Cream used on farm	22.75
Total	$2458.81

The average price received for butter was a fraction over 25 cents per pound wholesale and a fraction over 28 cents per pound retail. The milk from each cow is weighed at time of milking on milk scales that give the net weight and is recorded on milk record blanks. Each blank contains the record for one week for 14 cows. The skim milk credited in the foregoing was nearly all fed to pigs, along with green alfalfa in season; out of season, bran was used instead. We know there are larger dairy records and it would not be hard to beat this one, yet this shows an average of $94.57 for each cow. I regret that we did not keep an accurate account of the feed consumed. It did not, however, exceed $30 for each cow, which would leave a net profit of $64.57 per cow. GEO. W. DANA.

Deer Lodge, Mont.

Clarified Milk.

ED. HOARD'S DAIRYMAN:—My few lines regarding clarified milk seem to have greatly excited people who are putting milk through different processes with the idea of bettering the product. Mr. Moldenhawer on page 236, in criticism of a former article, most certainly shows he hasn't made a scientific study of the milk question. It was a noted New York physician who has made a more exhaustive study of infant feeding than anybody I know of, who said, of milk run through the separator, "It may be clarified, or modified milk, but it can never be milk" A microscopical examination of clarified milk, will prove that physical changes have been wrought; so also will a comparison of a jar of raw untreated milk and of clarified milk that have been carried around a delivery route. Anybody that wants to know the truth regarding milk that will make these two tests, will find my statement *is warranted*.

As to what properties have been removed by the centrifuge, as I said then, we haven't determined with enough accuracy yet to report. Research work takes considerable time even when there is nothing else to do, and as I have a dairy to superintend, it means research work goes very slow, but if these critics who are content with their present attainments and methods, will be patient, we will tell them what physical changes have been wrought.

In Dr. L. Fischer's work on Infant Feeding, they will find the hospital record of many cases where changing the diet from milk that had been through the centrifuge to milk that has not, cured the patient. An interview with most of the good pediatrics to this end will furnish more proof that raw, untreated milk is better than any other. If the DAIRYMAN desires it, we can give the data along this line.

I didn't write because of the competition of clarified—pasteurized milk, but to indicate more profitable and desirable lines in dairying, and as a pointer to those readers of the DAIRYMAN who want to not only do the most profitable thing, but also the right way, not turning aside to the by-paths of clarification and pasteurization.

I will say for their benefit, Mr. Moldenhawer to the contrary, that they do not and cannot compete with pure clean milk. I don't think because "insisting on sanitary conditions and scientific cleanliness" hasn't converted the masses is any reason to give up insisting on it, or instructing beginners in the right way, or reforming the breakers of all sanitary laws when possible. It is certain clarification isn't even a reformatory; pasteurization may be in a limited sense as now practised. If pasteurization was done at the milk producing centres within a few hours of milking, and handled rightly afterward, it would be of vastly more importance than as now conducted. After investigating many pasteurization plants I'm forced to confess that most places nullify the pasteurization by methods of bottling afterward.

That my suggestion regarding the distribution of the same milk on the same route daily isn't "absolutely impractible," I know because one very large contractor does it with all he retails and says he could do it with all the milk he handles. "It would require a little systematic work; I don't bother with for others because I don't have too; for myself, it is advertising," he says. The city milk supply ranks next to the public water supply and sewage disposal questions as related to the public health, and we cannot afford to stop short of the truth however it may affect existing systems or interests.

The men who keep in touch with the truth and adopt her teachings will have nothing to fear, but rather will be accounted wise above some of the past generation, and by enough of the present to make it profitable. F. L. MARION.

North Woburn, Mass.

Alfalfa in New Hampshire.

ED. HOARD'S DAIRYMAN:—I see in a recent issue of your valuable paper a man asks if any one is trying alfalfa in Vermont. Although I live in New Hampshire near Keene, I presume it will be of interest to read an account of my experiment last year. I send a root dug last week from a plot sowed in May, 1902, on land not fertilized for 8 years except by a crop of rye plowed under the last of April, 1902.

We found from a lot of different trial plots that the best way was to take a piece of dry, open land, plow under the old sod in last of April, harrow in 500 to 600 lbs. grass phosphate and 50 bushels hard wood ashes, seed 20 lbs. of good alfalfa seed and not cut till the alfalfa is in bloom, and only when in bloom unless weeds are ready to go to seed.

Our land needs lime, and alfalfa will not do well unless it has it.

I do not like manure, as it contains too much weed seed. My alfalfa did not winter kill at all and took well.

Keene, N. H. F. W. GUNN.

The alfalfa root sent was 28 inches long, a good illustration of the manner in which the alfalfa plant goes deep into the soil for food and moisture.

PRETTY CHEEKS.

A Food That Makes Girls Sweet to Look Upon.

The right food for young ladies is of the greatest importance to their looks, to say nothing of the health. Thin, sallow girls don't get the right food you may be absolutely certain. A Brooklyn girl says: "For a long time in spite of all I could do I was thin, skinny and nervous. My cheeks were so sunken my friends used to remark on how bad I looked. I couldn't seem to get strength from my food—meat, potatoes, bread, etc. So I tried various medicines without help.

"I often read about Grape-Nuts, but never tried the food until one day something impressed me that perhaps if I would eat Grape-Nuts for my nerves and brain I could digest and get the good of my food. So I started in. The food with cream was fascinating to my taste. and I went in for it regularly twice a day.

"Well I began to improve and now while on my third package I have changed so my friends congratulate me warmly, ask me what in the world I have taken, etc., etc. My cheeks are plump and rosy and I feel so strong and well. I sleep sound and it seems as though I couldn't get enough to eat. Thank you sincerely for making Grape-Nuts." Name given by Postum Co., Battle Creek, Mich.

There's a reason for Grape-Nuts.

Empire Empire

Eight Years Fifteen Cows

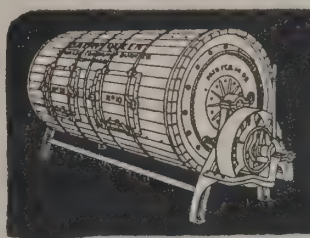
1895 1896 1897 1898 1899 1900 1901 1902

The Empire Way Makes Cows Pay.

How's This For a Record?

Emporia, Kans., Jan. 2nd, 1903,
Empire Cream Separator Co.,
Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times.



L. H. VAHSHOLTZ,
Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

Send for our new book on Making Milch Cows Pay.

Empire Cream Separator Company,
Bloomfield, N. J.
Western Office—FISHER BUILDING, CHICAGO.

Eight Years 75 cents for Repairs Fifteen Cows

THE DAIRY QUEEN

Combined Churn and Butterworker.

This piece of machinery suggests better things for the creameryman. It does not require a multiplicity of castings, gears and chains to operate; two gears and clutch pulley, that's all. The iron roll covered with corrugated wood is suspended in the churn upon a hinged lever, is operated by the movement of the churn and the butter and is held to its work by its own weight. It is at once

A MODEL OF SIMPLICITY AND USEFULNESS.

It saves time and labor, does not impair grain or texture of butter, thoroughly works out and facilitates drainage of buttermilk and secures perfect mixing of salt. For full description of this perfect working machine, write for free catalogue No. 13. We are manufacturers and dealers in Creamery Machinery, the Boyd Cream Ripener, Milk Cans, Cheese Apparatus, Milk Dealers' Supplies, etc. with separate catalogues for the several departments. Write us of your wants and we will send appropriate book.

REMEMBER we are not connected with any trust, but are an independent Company, furnishing high grade supplies at reasonable prices.

STURGES & BURN MFG. COMPANY,
Kansas City, Mo. Chicago, Ill. St. Paul, Minn.

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

"COME in the evening or come in the morning, when you're looked for or come without warning"—You'll always find your Tread Power ready for business. OF WHAT OTHER FARM MOTOR—Wind Steam or Gasoline—can this be said? A PERFECT GOVERNOR ensures absolutely even speed. Send for free catalogue.

St. Albans Foundry & Implement Co., St. Albans, Vt.

WRINGING WET Clothes dry is the reason for using any wringer. Saving clothes, buttons and money is the reason for using **Horse-Shoe Brand Wringers.** They are made with rolls of the finest Para Rubber. Every wringer is warranted. **THE AMERICAN WRINGER CO., 99 Chambers Street, New York.**

"1900" BALL BEARING WASHER sent free, without advance payment, freight prepaid both ways on 30 days trial. Mr. Geo. N. Burnet, Ashtabula, O., says, "Have done 1200 washings and is good for 1200 more. Beats them all, and have tried 8 different machines." Write at once to "1900" Washer Co., 219A State St., Binghamton, N. Y.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

BEGINNING early in May, Purdue University will operate the creamery equipment of its dairy department on a commercial basis, securing milk regularly from the farmers in the vicinity.

This step was prompted by the difficulty experienced in securing a temporary supply of milk at such times as it was needed for use of the students.

The equipment includes the latest styles of separators, combined churns, vats and cream ripeners. This equipment, with a supply of milk regularly, will make possible the study of many questions not heretofore touched on by the work of the Indiana Experiment Station.

Prof. H. E. Van Norman has secured H. N. Slater, of Fairmount, Minn., as assistant in the creamery work of his department. Mr. Slater is a creamey butter maker of wide experience, a graduate of the Minnesota Dairy School. and has served as instructor in the Starter and Cream Ripening Work at Minnesota. He was also an instructor in the Creamery Course at Purdue this past winter.

Indiana creamery men, butter makers and dairymen should take advantage of the establishment of a well equipped dairy department at Purdue by calling upon them for such information and assistance as they can render, feeling sure it will be cheerfully given.

CONSTITUTION IN DAIRY CATTLE.

Everybody is looking for some sign or external indication of vitality or staying power in their cows. We want cows that will stand to their work year after year, resist disease and do good service. We all value what we call "constitution" in our cattle, but we have some very queer and mixed notions of determining it. On this point, Prof. Haecker in one of his addresses says:

"An animal deep in brisket, with broad shoulders and fore legs far apart has no more stamina or endurance than one with a narrow, sharp shoulder and ewe neck. In fact, the latter as a rule, has more nerve force and endures longer. So far as my observation goes, an animal with a good middle and carrying little surplus tissue is fitted for much work and a maximum period."

We thoroughly agree with Prof. Haecker in the above estimate. How often we hear men say that a deep brisket and much width between the fore legs indicates great lung and heart power, when indeed it does nothing of the kind. That is an old beef cattle notion and is without foundation in fact. If anyone wishes to prove the truth of our utterance, let them compare the heart and lungs of a 1,000 pound dairy cow with those of a 1,500 pound beef animal of the most approved build between the fore legs. They will find in most instances that both heart and lungs of the dairy cow are larger than those of the beef animal. Indeed, there is reason for this. The dairy cow secretes a large amount of milk daily. This is a great draft on the blood circulation. The blood is vitalized by the lungs and she requires strong breathing power. This fact should compel us to provide an abundance of pure air for our stables, for we are beating ourselves if we do not.

Compare the build of the race horse between the fore legs with that of the draft horse. Yet will any man claim that the race horse is deficient in lung and heart power. It is very evident that the facts in these two cases do not justify the judgment of those who have reasoned in favor of the deep, wide brisket as indicating increased heart and lung action.

The best and truest indication of constitution in man and animals is the construction of the walls of the abdomen. A large, strong frame with a weak belly will not endure. On the contrary, a deficient muscular build with a strong muscular abdomen will often show surprising endurance. This principle is established by the structure of the umbilicus. A weak, spindling umbilicus indicates that the mother has very imperfectly nourished the foetus and the walls of the abdomen will be thin and weak and the power of endurance correspondingly reduced. It is the animal, as Prof. Haecker says, "with a good middle" not unduly large or pot gutted, but a belly with very strong muscular walls that will go to the end of the course and endure best.

This is constitution. It is well to remember, always, that large size in both men and animals is no indication of constitution or staying power.

THE PURPOSE OF THE COW CENSUS.

Many people have questioned the purpose of HOARD'S DAIRYMAN in subjecting itself to the serious expense of taking the various Cow Censuses which have appeared in its columns. This question can be simply answered. It is done for the purpose of getting at the bottom facts as they exist with the average cow farmers. It has proved impossible to arouse them to a sense of their condition and the losses they are sustaining by any ordinary talk in the paper, in the farm institute or anywhere else.

Because they keep no records they simply do not believe what is told them in the ordinary manner. So we resorted to something out of the ordinary. Nothing was ever before attempted which comes as close to the truth as do these cow census investigations. Some of the farmers who have been investigated declare the report is all a lie, but they forget that they helped the census taker to make up the farm end of the report and so far as the creamery end of it is concerned that is solid truth.

F. W. Lighty, of Adams County, Pa., in writing the *National Stockman and Farmer* says:

Some time ago I took a little private "cow census" in this part of Pennsylvania and the results were something like this: Visited 69 patrons of creameries who owned altogether 693 cows. Seven kept special dairy cows numbering 84 cows. The average gross income of these cows was $57. The 62 patrons who were possessed of 609 of those "go-between," "general purpose," "dual purpose" cows gave an average gross income per year (creamery figures) of $24.40. All the figures given by the patrons as to the cost of feeding the cows averaged $36.90 per cow.

This idea of taking local "cow census" is not original with me, but I found it extremely instructive. The same kind of work was done by different individuals in Northern Pennsylvania, in New York and in Wisconsin, but the results, as published in HOARD'S DAIRYMAN, showed practically the same state of affairs, viz., that the great mass of farmers keep cows to make manure, and that the manure cost them too awfully much. To induce these people to get away from these cows and get profitable ones, cows bred for a purpose, is one of the great reasons why I write these weekly letters, and unless some actual, tangible, ocular evidence in favor of those "general-purpose" cows is forthcoming I will promise to continue enthusiastically along the same line.

Mr. Lighty's purpose of trying to get the farmers away from unprofitable cows is our purpose in taking these census reports. Men must be convinced first of the facts in the case, before they will change. We want to get them to produce better cows, follow better methods and make more money in the business. We cannot bear to see them so stolid and contented in doing the right thing the wrong way and with wrong ideas of it generally. We understand perfectly well that many of these farmers do not thank us for taking off the cover and letting in the daylight, but we can't help that. We have only a few more years in which to labor in this field and our work is not yet done. This is the purpose we have in view in taking these reports. We are going to take 1,000 farmers, their herds and their methods before we quit. That will give us broad ground for securing a sound judgment of the average dairy farmer.

We wish he would average better, do better, think better, read more, and be a better dairyman, for his own sake. But the facts concerning him as he is, must come out.

EXPENSE AND PROFIT.

W. H. and A. W. Holley, of West Farmington, Me., have a herd of what is known as the Maine Jerseys, which they have bred and developed for plain, straight, creamery work. They are patrons of the Turner Centre Creamery. Is there anything to this business of good breeding and careful selection? Will it help the plain, ordinary farmer who patronizes a creamery and very naturally would like as much money from his cows as possible? The records show that the Holley Bros. get six dollars per month for each cow, at the creamery. So much for the use of good dairy sense in breeding, feeding and selecting. What can we learn from this incident? What can the man learn that thinks general-purpose cattle are more profitable to use in creamery work? Do any of the general-purpose patrons of creameries show such results? And ten to one, they spend more money for feed. The patron of a creamery is a special-purpose man, subjecting himself all the year to special-purpose expense. He ought to have the good sense to use a class of cows that will bring him the largest net returns for all this expense. When he plows he ought to use a special-purpose plow, not a dual-purpose plow and harrow. All of the combined reapers and mowers have gone out of use, because they were not as profitable.

Some day the farmers of the United States, who are doing dairy work, will study better than they have done the economic relation of expense to profit, and when they do that, they will very soon set about doing a dairy business with a special-purpose dairy cow.

SOME OF THE CAUSES FOR THE LOW PRICES OF EASTERN FARM LANDS.

Jas. M. Plato, on page 268 of this volume, touches upon the high prices of lands in some states and low prices in others. He does not see exactly why such a disparity exists, especially if the returns from the lands are anywhere near equal. There is one phase of this question we wish to speak of. Forty years ago we saw farms in New York, for instance, selling at $100 an acre that today we can buy at from $30 to $50 per acre. To a certain extent there has come a loss of fertility. The old men who handled those farms were good farmers. They took good care of the fertility of their lands. Their places have been filled by a different class of men. Farming has grown unfashionable. All the brighter young men have left for the cities or the west. As a result there has been a crowding of farms on the market; more farms for sale than there are farmers to buy them. As the old American stock of farmers died off there has not come new farmers to take their places. This has been the chief cause of depreciation. The system of education, even in the country district schools, has not helped make farmers. On the contrary, it has educated farmers' boys away from the farm. When the supply of farmers goes down, the prices of farm lands go down also. When there are plenty of men who want to buy farms, then the prices go up. Under this condition of things, depreciation of fertility to a certain extent and a reduction in the number of men who want farms, prices for farm lands can not help rule low.

In Wisconsin and its sister states the situation is different. Here there has been a steady increase of value in farm lands because, largely, immigration from foreign countries has constantly brought us a supply of farmers who wished to purchase our farms as fast as the old Yankee owners relinquishd them. In addition, these German, Scandinavian and Polish farmers have big families, the same as the old American farmers did back east 50 years ago. Nearly all of the sons want farms. That creates a constant demand for farm lands. Then again, these foreign farmers have been thoroughly trained to care for the fertility of the soil. They keep large numbers of cows, young cattle and hogs on their farms, the same as the old New York farmers did. That helps to keep up fertility and fertility helps to keep up prices.

The eastern farmers must take hold of their system of country schools and make them of use in educating their sons so they will have a taste for the farm. Then, besides, they should do something to turn the tide of emigration their way. When these things are done we will see much higher values attached to eastern farm lands.

A CHANGE OF FRONT.

Commenting on the new regulations regarding testing cattle imported from Great Britain to America, the *Scottish Farmer* concludes:

"The policy of the United States with reference to Channel Island cattle is peculiar. Many things in the United States are peculiar, and one more or less need not put us out. It appears that Mr. Salmon and his Bureau are convinced that Channel Island cattle bred in the Channel Islands, are so absolutely free of tuberculosis that they, and they alone of all cattle, may now be entered at any port in the United States without undergoing the tuberculin test. This indicates a very astonishing change of front on the part of official persons. We do not understand it. The reasoning is faulty. If Channel Island cattle are so healthy, the test will not do them any harm, and it is too much to ask us to believe that their freedom from the disease is the cause of the new ordinance. According to every accepted theory, Channel Island cattle ought to be healthier in Great

Britain than on the coast of France. Their alleged healthfulness does not demonstrate that human and bovine tuberculosis is not the same disease. The logic of the situation now created is the abolition of the tuberculin test in the United States. If dairy cattle of the deepest milking propensity are absolutely free of tuberculosis, there is no such disease as tuberculosis. The action of Mr. Salmon's Bureau is definable as humbug.

The *Scottish Farmer*, as the strong phrase goes, "is all off" in its conclusions. The reason for the action taken by the Bureau of Animal Industry, concerning Channel Island cattle is based on the fact that every tuberculin test thus far fails to reveal the presence of the disease in Jersey and Guernsey. On the contrary, the tests of cattle coming from England, show an alarming percentage of tuberculosis in all breeds. It is hard to beat facts as a basis for judgment. If the English farmers desire to market their cattle with profitable freedom, let them take hold of the tuberculosis question with fearless vigor.

Which is Better, to Purchase or Raise Ones' Cows?

A Massachusetts Inquiry.

ED. HOARD'S DAIRYMAN:—Having become a subscriber (as I have intended for some time) through one of your patrons, Mr. J. J. Packard, I would like to inquire through the columns of your valuable paper from some one that knows what he is talking about from experience, if there is any better way to run a herd of cows for profit for milk, than the way I am running mine. I have no pasture, but keep 80 to 90 cows of grade Holsteins, Ayrshires, Guernseys and Durhams. I do not breed any of them. Buy them in lots of 5 to 25 at a time, average cost about $50 per head. They bring on an average about $38 per head for beef. They average better than 10 quarts of milk per cow per day. When they get below 8 quarts per day, I let them go if the beef market is good; if not, I hold them for a while, if there is any prospect of a better market in a short time. I keep them in the barn the year round tied with chains; water in front of them of which the chill is taken off by the use of steam in winter. Their feed consist of about 30 lbs. of ensilage, about 6 lbs. of clover hay and 12 lbs. of grain of the following mixture: 3-5 winter bran, 2-5 cotton seed meal, fed dry.

My milk trade is retail, mostly at 7 cents per quart; some wholesale at 45 cents per can of 8½ quarts. The question is this: Would it pay any better to breed my cows and keep them over, or use thoroughbred cows and breed them? I raise everything but hay and grain. Buy my hay at $12.50 per ton. M. C. S.

Brocton, Mass.

The conditions named in this inquiry forbid its answer by the editors, as they have not had the experience called for. The question—a very important one, it may be added—is therefore referred to our readers for reply. Meantime we may say that the plan pursued by our correspondent, is, in most respects, similar to the prevalent practice of many dairymen in northern Illinois, but it has never commended itself to our personal judgment. Moreover, several successful Wisconsin dairymen, intimate personal friends of the editors, who at one time followed this system, later abandoned it and, putting full blood dairy sires at the head of their herds, found it more profitable to raise cows than to buy them. It is but fair to say, however, that these men made up their milk into butter, or were patrons of creameries, and, therefore, had plenty of skim milk for feeding to calves.

Let us have this question discussed, as our correspondent requests, from the standpoint of experience.

Pasture for Hogs.

(Press Bulletin.)

The Kansas Experiment Station has realized $11.90 per acre from rape pasture and $24.10 from alfalfa pasture in ninety-eight days. These results were obtained from the following experiments, which were begun July 25 and concluded October 31, 1902:

Thirty shoats, averaging 52 pounds in weight, were divided as nearly equally as possible into three lots of ten each. Lot 1 was fed on a grain mixture of shorts one-half, corn-meal one-fourth, and Kafir corn meal one-fourth, in a dry lot. The other two lots were fed the same grain ration, but one received rape pasture and the other alfalfa pasture in addition. Each lot was given what grain the hogs would eat up clean, and each had access to water and ashes. The weights of grain consumed and gains made are as follows:

	Grain consumed in pounds.	Total gain, in pounds.	Grain consumed per 100 lbs. gain in pounds.
I. No pasture	3801	1023	371
II. Rape pasture	3244	1076	301
III. Alfalfa pasture	3244	1078	300

The gains of the three lots are very nearly equal. The dry lot consumed 557 pounds, or 70 pounds for every 100 pounds of gain, more grain than the pasture lots. The lot on rape required one acre of pasture while the alfalfa lot used a trifle less than one-half acre.

The lot without pasture required 3.71 pounds of grain, to produce one pound of gain. Assigning the same value to the grain fed the hogs on rape pasture, we have 877 pounds of pork credited to the grain and 199 pounds credited to the rape. At six cents per pound, the price at which hogs were selling at the close of the experiment, this would be a credit of $11.90 per acre for the rape. In a similar manner the alfalfa is credited with 201 pounds of pork, equal to $12.05, and as there was only a half acre of alfalfa this makes a rate of $24.10 per acre.

The cost of preparing the seed-bed and seeding the rape was $1.80 per acre. It was seeded in the feed lots on soil that would otherwise have remained idle, or would have grown up to weeds.

The shoats on pasture enjoyed their diet and seemed satisfied. Those in the dry lots seemed to be hankering after something green, and their appetites seemed unsatisfied without some kind of roughness. They would even nibble at straw in a vain attempt to satisfy their craving.

The experiment emphasizes the superior value of alfalfa pasture. Where alfalfa is not available, or where variety is wanted or it is desired to utilize otherwise waste land, Dwarf Essex rape, seeded at the rate of six to eight pounds per acre any time from early spring to late summer, will furnish an excellent diet that is greatly relished by the hog. Succulence and variety will make healthier hogs that will return increased profits.

Manhattan, Kan. D. H. OTIS.

Silo Constuction.

ED. HOARD'S DAIRYMAN:—I want to help our good German friend in his earnest effort to interest the DAIRYMAN'S readers in the silo. While I am a native Tennessean, yet on my mother's side I am as Dutch as a keg of sour-krout, but on my father's side I am as Irish as a bag of potatoes. With this mixed blood runs mixed ideas and perhaps I may be able to touch some sympathetic chord among your multitude of mixed readers.

I see in your creamery investigations a great majority of the patrons milk only ten or fifteen cows, and a very small percentage of these small dairyman use silage. This I can account for only in two ways. They either do not know the real value and cheapness of silage as a dairy ration, or they are afraid of the cost of building a silo. I have traveled both of these paths and can speak from personal experience. I have let the fear of expense of building a silo keep me for years paying out nearly all the profits of the dairy for mill feeds, but not so now.

Nine years ago I built my first silo and I consider it the best investment I ever made. I was not dairying for fun, but for the living there was in it, and had no money to throw away, so studied economy, and built the first combined earth and stave silo ever built in this state. I found it cheap and nine years' trial has proved entirely satisfactory. I will outline my plan for the benefit of small dairymen who, like myself, feared the expense.

First lay off a circle and dig a round cistern in the ground eight or ten feet deep. Lay around the top of this a foundation two brick thick, with cement mortar. Buy good, square-edged 2×4 pine studding, such as is used by carpenters in building good frame houses. Take it just as it comes from the saw; do not bevel or dress. If this cistern is eight feet deep, and fourteen-foot studding is used, twelve feet in diameter, the silo will hold about fifty tons. Sixteen or eighteen-ft. length can be bought of lumber dealers in the cities. Do not build less than twenty-two feet, and a few feet added height is better. When ready to set up the tub have a scaffold ready so that one can work at the top and one at the bottom. Set up the first stave, get it perpendicular and nail to scaffold at the top. Then nail across this piece an old barrel stave on the inside near top and bottom. Set up the next piece and confine in place by driving small nails through the old barrel stave. The natural curve of the old staves is about right for the circle you want. Use more old staves as needed until when the tub is finished it is standing straight around the brick foundation and held in place by the two inside hoops of old barrel staves and there is nothing in the way outside to hinder putting on the iron hoops. These are best made of ⅝ round iron, in sections, with threads and nuts on each end. For a silo 12 feet in diameter each hoop will consist of three rods of the iron about thirteen feet long. For a fourteen-foot tub I use eight hoops, putting them closer together at the bottom where most pressure is; buy cast iron lugs to pass the rod ends through to make the connection. Hard wood blocks will do, but iron lugs are better, less trouble, and cheaper in the end. Place the hoops so as to allow for two or three doors; I think two is enough; one about sixteen inches from the ground, with two hoops below it, and one about eight feet from the ground. Mark off the doors six or seven staves wide and about twenty-eight inches high, trim battens to fit the circle and nail securely on outside. Best to have three strong battens to each door. After all is drawn up tight and snug, one hoop with another, saw out the doors. Cut these with a bevel larger on the inside, so that when put in place, in filling, the pressure of the silage will hold in place. When filling, tack a square of tarred roofing paper over these doors to make perfectly air tight. In feeding out, begin at the top and take out the doors as they are reached. I feed with large open mouth baskets, holding a feed for three or four cows; use two baskets and handle with rope and windlass, very easy; let down on light truck to take to the mangers with but little lifting. The best tool to handle the silage in filling the baskets is a good six-tined manure fork.

These silos are cheap, easily built and entirely satisfactory. If any one fears their drying out and falling down when empty, tack one or two outside hoops on, made of common plaster laths, or take a turn on the nuts with monkey wrench, when drying out. Any kind of open shed board roof can be put on to keep out rain and snow. Cement the joint where the wooden tub sets on the brick to make air tight, and about eighteen inches down on the clay to keep out surface water.

Darks Mill, Tenn. J. N. MERONEY.

Cotton Seed Meal and Abortion.

ED. HOARD'S DAIRYMAN:—In your issue of April 24, under Inquiries and Answers, you seem to be in doubt about the effect of cotton seed meal on abortion and hesitate to recommend it as a feed during the later months of gestation. Our experience has been in favor of cotton seed meal as a food during the gestation period and will cite the following:

For several years previous to two years ago we had had a very great deal of trouble with abortion in our herd of fifteen cows, so much that we lost fully two thirds of the calves. About two years ago we began feeding cotton seed meal with dried brewers grains and a very little corn and cob meal, and have not had an abortion since. They were the same cows, kept in the same yard, and the same stables, and nothing was done to disinfect them in any way. We have always attributed the change to the feeding of the cotton seed meal.

We have also made inquiries of careful, observing dairymen in this section who have been troubled with abortion, and they seem to have had the same results after feeding cotton seed meal, and our opinion is that where abortion still exists where cotton seed meal is being fed it is due entirely to other causes and not to any effect of the meal in question.

Pottsgrove, Pa. C. H. MCMAHAN.

We are much obliged to Mr. McMahan for this report of his experience with cotton seed meal. If it should be questioned whether the cotton seed meal was the cause of the abatement of abortion in his herd, on the theory that the experience is not wide enough to justify the conclusion, or that perhaps other causes intervened, or that, as quite frequently happens, the cows became immune, it remains quite evident that the feeding of cotton seed meal did not have the effect so often attributed to it.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Overrun of Butter.

Please state through the DAIRYMAN how the calculation is made to find number of pounds butter from 16 lbs. milk that tests 7% or if 5% milk gives 1 lb. butter from 16 per day, what amount of butter will 7% give from 16 lbs. per day? T. R. DES.

Lanford Station, S. C.

Sixteen pounds of milk containing 5% fat will contain .80 pound of butter fat. If we add ⅛ overrun to the above, the 16 pounds of milk will make .9 pounds of butter, or 11.4 ounces. In the same way 16 pounds of 7% milk will contain 1.12 pounds of butter fat, adding ⅛ for overrun will make 1.26 pounds of butter, or 1 pound, 4¼ ounces of butter. The calculation in full would be as follows:

16	16—Lbs. of milk.
.07	.05—Per cent of fat.
8)1.12	8).80—Amount of fat in milk.
.14	.10—Amount of overrun.
1.12	.80
1.26	.90—Total weight of butter in lbs.

Indian Wheat Inquiry.

Will Mr Cowen of Vermont, tell a southern subscriber what kind of a plant Indian wheat is? How it is cultivated and where the seed can be obtained? We would like to find a substitute for cottonseed meal. WM. B. TURNER.

Virginia.

Clover, Silage

There seems to be a conflict of opinion on the subject of preserving clover in the silo. What is your opinion and experience? Can clear red clover be used for silage? Is it safe to put it into a good stave silo? Can we do so and have a reasonable expectation of its coming out good feed?

We keep twenty-five cows and depend on corn silage but think if we could have clover to help out, it would increase the cream yield and reduce the grain bill. This grain bill is what is troubling us here in the east. F. E. M.

Greenfield, Mass.

The editors of HOARD'S DAIRYMAN have had no personal experience in siloing clover. They have however, at different times, had opportunity to inspect clover silage and found it in very excellent condition. They have also received and published frequent communications from readers in different parts of the country reporting most excellent success with clover silage. They are therefore convinced that it is entirely practicable to preserve clover in the silo, either uncut as it comes from the field, or by running it through a cutting box the same as corn. In their judgment, the latter practice is the better one.

As stated above, the editors are without personal experience with clover silage, their practice being to fill the silos with corn and use the clover for hay, both in connection with silage and in connection with summer pasturage. One who has never tried it, will be surprised at the amount of hay cows will eat when on very best pasture, and the fact that they have such an appetite for hay at such times is to us conclusive evidence that it is a very important, if not an indispensable, item in their feed. Hence, we prefer to make the clover into hay and use it as dry forage rather than attempt to cure it in the silo.

It is the same with alfalfa, but we do not consider that either alfalfa or clover hay with silage makes a complete or satisfactory ration. although it takes less grain with alfalfa than with clover. The cow, even in moderate flow of milk, must have a reasonably liberal amount of feed, and experience seems to lead to the conclusion that neither her storage nor digestive capacity suffices to get the required nutriment from coarse feeds alone. Hence, some concentrates should be used. With clover hay and silage, we think at least one-fourth of the dry matter should be in the form of concentrates. With alfalfa and silage less suffices, and, what is perhaps still more to the purpose, the expensive protein feeds can be largely dispensed with.

A Wisconsin Ration.

Please give me the cheapest balanced ration from field corn silage, corn fodder, timothy hay for roughage, and ground oats, $20; ground corn, $12; bran, $16; oil meal, $28. I like the DAIRYMAN very much. W. A. D.
Footville, Wis.

Without any information as to the size of the cows, their condition as to lactation, whether fresh or strippers, it is a pretty wild guess to suggest a formula. However, assuming that these cows are of average size, that they are of average quality, that some are fresh or nearly so, and some are already beginning to shrink perceptibly, we might submit the following as a fair average daily allowance for an ordinary herd of cows.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
8 lbs. corn stover	4.76	.14	2.59	.06
5 lbs. timothy hay	4.34	.14	2.17	.07
8 lbs. bran	7.05	1.00	3.09	.24
Total	24.07	1.67	12.05	.58

It would quite materially improve this ration to add one pound of oil meal. Oil meal contains a little more than twice as much digestible protein as bran, and with silage, corn stover and timothy hay for roughage, the peculiar demand is for protein. This is one of the reasons that we have omitted oats and the ground corn, which, at the price named, we suspect to be corn and cob meal.

Elevating Silage.

I have used the chains and slat carrier for elevating ensilage, but have a good deal of trouble, wind blowing leaves out, although mostly covered, and scattering. Do you know of anyone using belt and cups like grain elevators and with what success, use large sized cutter? W. F. W.
Benson, Minn.

We have never heard of anybody using the belt and cups like grain elevators with silage and have very serious doubt as to whether they would work, and if they did work, whether they would prevent the scattering of the finer portions of the silage when the wind blows. We have had very good success in preventing this scattering by covering the elevator throughout its entire extent. The probabilities are also, that sooner or later, the attachments, for elevating silage with a blower, will be provided for all sorts of cutters.

What to Breed to Jerseys?—How Much Should Heifer With First Calf Yield.

I have a few full Jersey heifers and I also have a few grade heifers (Jersey) Will you please tell me which will be the best to buy, a Jersey or a Guernsey bull to breed to them, to build up as fast as possible. I personally prefer Guernsey, but am told that Jerseys are better; as my heifers are Jersey, please tell, were you in my place, which you would buy.

I have a young cow 2 years old, that dropped a calf in February. She gives about 16 lbs. milk; at first gave 20 lbs. Would you consider her worth keeping to milk as a profit? What would you consider an average quantity and quality of milk for a young cow with first calf to give to indicate a good prospect for a dairy cow. W. H. A.
North Carolina.

Jerseys and Guernseys represent qualities so nearly alike that cross-breeding between them results in many happy nicks, but we do not think it advisable, as a rule, to cross-breed full-blood and registered animals. No doubt but what the progeny may be equally valuable as dairy animals, but not being eligible to registry anywhere, they are not as valuable for breeding purposes. If our friend personally prefers Guernseys, we should advise him to exchange his full-blood Jerseys for Guernseys, or otherwise provide a full-blood Jersey sire for the Jerseys and use a Guernsey sire for the grades.

A two year old heifer, now two months in milk and giving sixteen pounds daily, we should consider a very promising animal. It is a very difficult matter to specify the daily quality and quantity of milk a heifer should give to indicate a good prospect for a dairy cow. It is not so much what a heifer can do in one day, one week or one month, as it is what she can do in twelve months. We think we may say with a great degree of safety, that the large yearly producers of milk and butter have not been noted for the largest daily or weekly yields. "Keeping everlastingly at it" is what tells with a dairy cow.

A Ration Based Upon Cotton Seed Products.

Please tell me how to proportion feed for cows. Some fresh to pail and balance strippers; getting a small allowance of grass, with feed stuffs at following prices: Cotton seed meal, $23 per ton; cotton seed hulls, $5 per ton; wheat bran, $26 per ton; corn meal, 70 cents per bushel; hay, $22 per ton. J. L. G.
Dublin, Ga.

The prices quoted for bran and hay and apparently for the corn meal are practically prohibitive. A bushel of corn meal weighs only about forty-seven pounds and if this costs seventy cents, it is at the rate of $30 per ton. If the price given is for the meal per bushel of corn rather than a measured bushel of the meal, then we would advise using the corn meal quite liberally.

Left with only cotton seed meal and cotton seed hulls from which to construct a suitable ration formula for milch cows, we give up in despair. From our point of view, it cannot be done. We are, however, perfectly well aware that a great many cow keepers in the South feed their cows exclusively upon these cotton seed products and with what appears to be fair results.

The wonder to us is, that with soil and climate so well adapted to raising the very best varieties of fodder and grain for milch cows, that so many southern dairymen still depend upon cotton seed meal and cotton seed hulls as their main reliance for cow feed. Alfalfa, clover, cow peas and soja beans are nowhere so much at home as in the southern states, nowhere do they yield so remunerative crops, nowhere are they more needed for bringing up the fertility of the land. J. L. G. should certainly devote as many acres to cow-peas as he has cows in his herd and do this, not next year or at some future period, but this present season.

In saying this, we must not be understood as even so much as intimating that cotton seed meal and cotton seed hulls have not appropriate places in a ration formula for cows, but simply that an exclusive diet of these products is seriously objectionable.

A Practical Impossibility.

Please give me a balanced ration for 16 cows. I feed cotton seed meal, wheat bran and cotton seed hulls. I don't think the cows are giving as much milk as they ought to. J. C. T,
Eufaula, Ala.

See answer to J. L. G., this issue, where practically the same question is submitted. In the present case, if the price of bran is materially less than that quoted by J. L. G., we should say "use at least a pound of wheat bran with every pound of the cotton seed meal," and feed not to exceed six pounds of the mixture daily. From our point of view, it is neither safe, and if safe, it would not be prudent, to feed more than three pounds of cotton seed meal daily.

"ADVERTISEMENT."

Dr. Shoop's
Rheumatic Cure
Costs Nothing If It Fails.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever. I have done it fully 100,000 times.

I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.

Address Dr. Shoop, Box 934, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists'

Weight of a Gallon of Milk.

Will you please give me the weight per gallon of milk testing about 4 per cent.

I am selling milk at 15 cents per gallon wholesale, and the party says that one gallon will weigh 8.6 lbs., and I contend that 8.1 is correct.

Chattanooga, Tenn. W. S. B.

A gallon of milk weighs 8.6 pounds. There would have to be 50% fat present to make a gallon weigh 8.1 pounds.

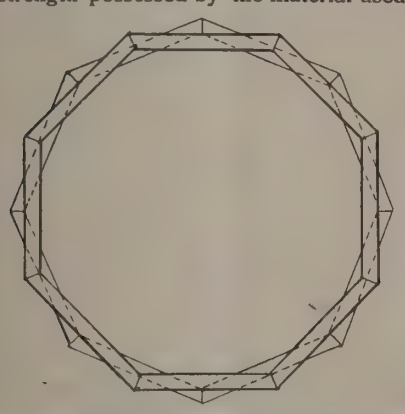
Skim Milk Returned.

Will you kindly state in your next issue, how much skim milk in pounds, should be returned to me from a creamery, if milk were 3%, or if it were 3½%, or 4%, or 4½%. F. P.

Saugerties, N. Y.

It will depend somewhat on how thick a cream is being run, but as a rule from 15 to 20% is removed from the whole milk as cream. This would make 80 to 85 lbs. returnable as skim milk from every 100 lbs. of milk delivered.

Mustard Greens for Swine.



Will mustard greens (cooked) hurt hogs?

Alabama. J. C. T.

As mustard greens frequently constitute a much relished addition to our own dinners, we conclude they cannot be harmful when fed to swine.

An Improved Octagonal Silo.

There seems to be no end to the different styles or forms in which silos may be constructed, and each one possessing some merits peculiarly its own. We present herewith a diagram showing a longitudinal section of an improved octagonal silo. It might well be called a double octagon or a sixteen sided silo. The diagram shows two eight-sided rims or girts imposed one upon the other in such a way as to give the maximum amount of strength possessed by the material used.

To ascertain the length of one side for a silo of any dimension, multiply the extreme diameter from one corner to its opposite corner of the proposed silo by three and divide this product by eight. For example, if the extreme outer dimensions of the proposed silo are twenty feet, we multiply this sum by three, giving us sixty for a product, and divide this by eight, giving seven and five-tenths or seven feet and six inches as the extreme outside length of one of the sides. With an extreme diameter of sixteen feet, each side would be six feet. These figures are not absolutely accurate, but sufficiently so for all practical purposes. For example, in a sixteen-foot silo, the exact length of a side would be six feet, one and one-half inches.

Having ascertained the length of one of the eight sides, make a pattern of the proper length with the ends shaped to the proper angle and use this for marking off all the pieces required for girts. The proper angle or bevel for the ends can be obtained in various ways. For one not expert in such matters, perhaps the simplest plan would be to lay the proposed pattern on some clear and level place, and then with a pole or string half the length of the proposed diameter, find a point which shall be exactly equi-distant from the two ends of the proposed girt. A line drawn from this point to the end of the girt, will give the proper angle or bevel.

With such short sides, and so firmly tied at all points, very light lumber may be used. One of the girts might be made of 2×6 lumber and one superposed upon it could be made of 1×6 lumber. If preferred, instead of using a full octagon for the upper part of the girt, ties or braces can be nailed across.

For a silo thirty feet in depth, there will be required eight of these longitudinal girts; the 5 lower ones may be spaced three feet apart and then increased as may be necessary to reach the top. These girts will be in effect hoops, more easily constructed in many places than the proposed round hoops because of the difficulty of getting suitable material to bend into the round form.

Any sort of lining suitable for any other style of silo may be used in a silo built after this manner. Probably the most effective and the most durable lining would be, first, a sheeting of common lumber, over this a layer of the P & B Giant Paper and this covered with another lining of boards. The inner lining should be sound lumber, but it need not necessarily be matched. Experience has shown that the ordinary building paper is not durable, as it will not withstand the acid in the silage. Hence, we recommend the special brand of paper made by the Standard Paint Company of New York.

Dutch Belted Cattle Association.

ED. HOARD'S DAIRYMAN:—The Annual Meeting of the Dutch Belted Cattle Association of America will be held on Thursday, May 21, 1903, at 12 o'clock noon, at the Fifth Avenue Hotel, New York City.

A full attendance of members is desired.

The closing and publishing of Vol. VII will be considered at this meeting.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Feeding Whey to Calves—Stricture in Teat.

ED. HOARD'S DAIRYMAN:—Noticing W. T. L's. inquiry from Vassar, Mich., regarding feeding whey to calves, I would like to tell him of the way I have used it for some years. Commence by feeding it with ½ warm water and have water warm enough to make the whey of the temperature of new milk, adding a small quantity of oil meal. Gradually add more whey and in 10 or 15 days work them on to clear, cold whey. It is a good calf feed if used with care, and oil meal, and aside from the color, it seems as good to me as factory separator milk.

What is the cause of strictures in teats; milk tube produces more fever. Have more trouble with this than anything else in my dairy. W. A. J.

Orwell, Vt.

The real cause of this trouble is not known. The remedy is the teat bistoury. A milking tube does little or no good in these cases.

Prof. Haecker on Milk Production.

Henry Wallace, in his *Farmer*, boils down and makes plain the conclusions of Bulletin No. 79 of the Minnesota Experiment Station as follows:

The scope of inquiry embraces four points: The food of maintenance, or the food required to keep a dairy cow in present condition, neither gaining nor losing; the nutrient requirements, or the amount of food and the kind of it required during the milking period; the protein requirement, that is, the amount of flesh-forming matter necessary for dairy cows of different capacity; and, lastly, the influence of the stage of lactation, or the time she has been giving milk, on the nutrient or food requirements.

This is a bulletin of special value to the thoroughly up-to-date dairyman, but the man who has not put his mind to it will receive very little benefit from it. It is meat for strong men and not milk for babies. We will try to stew the meat down so that any farmer who can milk cows, can get some little out of it.

In all our talk about rations we have been dependent on what is known as the Wolff standard, or conclusions from a series of experiments made in Germany many years ago. There has been for some time a feeling that these were not correct and that a less amount of protein was required than prescribed by these standards, which are the basis of nearly all our calculations of feeding rations. It has been suspected for some time that these were not correct, that they required more flesh-formers than the animal required, and it is to solve this problem that Professor Haecker has been laboring with such zeal and ability for many years.

On the first point he concludes that the factors for the food of maintenance in the Wolff standard are in excess of the requirements, and that a daily allowance of 11.38 pounds of dry matter containing .63 of a pound of protein, 5.75 pounds of carbohydrates, and .12 of a pound of fat, per thousand pounds of cow, was all that a cow requires, and a little more, and that the addition of about a tenth more protein, a fourth more carbohydates, and eight times as much fat, is all that is required for a cow in full flow of milk.

On the second point he concludes that the Wolff-Lehman standard, or modified Wolff standard, makes the same mistake and does not recognize the fact that quality of milk should be considered as well as quantity.

On the third point he concludes that a nutritive ratio of 1 to 7.7 and 1 to 9.7 would be quite as effective as that of 1 to 6.3, which last is above the Wolff standard.

On the last point of inquiry he finds that cows in the early period of lactation lose rapidly in bodily weight, that the milk given for the first eleven weeks is in excess of the amount provided by the food consumed; therefore, the cow takes it from her own body. After that the amount of food given when a balanced ration is furnished is in proportion to the amount of milk produced.

We have made this as plain and simple as we can, and it is likely that all we have done is to satisfy farmers who have not given attention to this subject, that if they would get the best results from their cows, they will have to go to studying and find out how to get the very most out of their cows and out of their feed. They cannot do this without feeding approximately a balanced ration. It may be some satisfaction to them to know that in order to get a balanced ration they do not have to feed as much protein or flesh-formers as they have been told is necessary to do. There is, however, no danger of their feeding too much. To get there they will not have to go as far as it was supposed they would. There is a whole lot about cows that nobody has found out. Professor Haecker comes probably as near it as any man.

Farrowing time is a dangerous period to both sow and pigs. The mother will get along better and the pigs be more certain to live, if she is fed

PRUSSIAN STOCK FOOD.

It conditions the stomach and bowels, allays all fevers, and produces a large flow of rich milk for the suckling pigs. Sows conditioned on this food will not eat their pigs. Then, too, it insures both mother and pigs against cholera, swine plague, etc.

Prussian Stock Food is guaranteed to give satisfaction when used according to directions. If no dealer at your place write us. Tell us how many head of stock you have and where you saw this ad and we will send you our 68 page **Farmer's** and **Stockman's Hand Book Free.**

We also make **Heave Powders, Worm Powders, Lice Powders, Spavin Cure, Poultry Food, etc.**

PRUSSIAN REMEDY COMPANY, ST. PAUL, MINN.

Gentlemen:—Please send me two 25lb. pails of your Prussian Stock Food, as I ordered one pail and used it on a bunch of twenty hogs. I think it is the food for hogs as it keeps them healthy and makes them grow fast; and it is a cheap food and should be fed to pigs that are being weaned.—M. B. Graham, breeder, Remington, Ind.

Butter Tests Accepted for Record by the American Jersey Cattle Club.

Biltmore's Rose 150717—Sire, Trevarth 39280; dam, Woodland Rose 3d 119913; butter, 17 lbs., 5 oz.; milk, 281 lbs., 8 oz. Test made from March 1 to 7, 1903; age, 4 yrs., 11 mos.; estimated weight, 880 lbs.; fed 17 lbs. bran, 17 lbs. cotton seed meal, 10 lbs. gluten meal, 17 lbs. brewer's grains, 10 lbs. dairy feed, 7 lbs. linseed meal and 7 lbs. corn meal, corn ensilage and timothy hay. Property of Biltmore Farms, Biltmore, N. C.

Kate of Biltmore 131014—Sire, Tormentor's Harry 29920; dam, Kate Winslow 28055; butter, 16 lbs., 6⅛ oz.; milk, 178 lbs. Test made from April 5 to 11, 1903; age, 5 yrs., 8 mos.; actual weight, 1040 lbs.; fed 45 lbs. bran, 17½ lbs. cotton seed meal, 17½ lbs. distillers grains, 8¾ lbs. gluten, 8¾ lbs. dairy feed, 7 lbs. corn and cob meal and 7 lbs. linseed meal, ensilage and corn stover. Property of Biltmore Farms, Biltmore, N. C.

Harrowgate of Biltmore 127233—Sire, Joseph P. S. 2008, C., J. H. B.; dam, Harrowgate F. S. 5047 C. J. H. B.; butter, 18 lbs., 13¾ oz.; milk, 330 lbs., 12 oz. Test made from December 24 to 30, 1902; age, 7 yrs., 7 mos.; estimated weight, 850 lbs.; fed 20 lbs. bran, 20 lbs. cotton seed meal, 35 lbs. brewers grains, 9 lbs. gluten meal, 9 lbs. linseed meal, 22 lbs. hay, 70 lbs. roots and 140 lbs. ensilage. Property of Biltmore Farms, Biltmore, N. C.

Very Much More 140733—Sire, J. J. Signal 40512; dam, Very Much 41599; butter, 24 lbs., 2 oz.; milk, 260 lbs., 2 oz. Test made from March 7 to 13, 1903; age, 5 yrs., 3 mos.; estimated weight, 950 lbs.; fed 25 lbs. wheat bran, 24½ lbs. crushed oats 34½ lbs. corn and cob meal, 12 lbs. oil meal, 25½ lbs. proto-grain and 202 lbs. corn ensilage and hay.

Friar's Duke's Ethel 136852—Sire, Friar's Duke 36416 dam, Ethel Albertine 70654; butter, 19 lbs., 14 oz.; milk, 269 lbs., 12 oz. Test made from March 25 to 31, 1903; age, 6 yrs., 1 mo.; estimated weight, 800 lbs.; fed 64 lbs. bran, 17 lbs. corn meal, 17 lbs. cotton seed meal and 20 lbs. hay, vetch and Johnson grass pasture.

Merry Maid of Millbrook 159369—Sire, Diploma of Millbrook 46123; dam, Cream of Millbrook 139828; butter, 15 lbs., 7½ oz.; milk, 229 lbs., 14 oz. Test made from January 26 to February 1, 1903; age, 3 yrs., 6 mos.; estimated weight, 740 lbs.; fed 56 lbs. bran, 21 lbs. corn meal, 28 lbs. cotton seed meal, 14 lbs. linseed meal and 42 lbs. alfalfa hay.

CONCERNING OUR ADVERTISERS.

THE SHEPHERD AERATOR.

Dairymen who have a care as to the condition of their milk when it starts to market, must be interested in the Shepherd Compressed Air Aerator advertised elsewhere. It has come to be an immensely popular appliance with good milk producers. It is most simple in operation, no other vessel than the milk can is required, which saves cleaning, and it works while the milking is going on, and cans are ready for the wagon almost on the minute the milking is done. Or the aerating may be continued as long as desired without lifting or changing the position of the milk. Only a few strokes of the pump are required to start it going and the air bubbles passing up from the bottom of the can surely do good and perfect work in purifying. The advertisement with excellent cut elsewhere, should not be overlooked.

THE "THINGINESS" OF THINGS.

Before one can accomplish much in any field of endeavor, he must understand his particular line of business "from the ground up"—he must be able to go to the core of his work and get at the "thinginess" of the thing, as it were. Precision in statement, for example, is a very essential accomplishment, and yet how few ever attain it. Were you requested to define the simple word "thing", would you not be embarrassed? Webster defines "thing" thus: "Whatever exists or is conceived to exist, as a separate being, whether animal or inanimate." Simple enough, isn't it—and yet not one person in a thousand could clearly define the word. When it comes to harvesting machines, however, accurate information seems to have been more generally disseminated. The majority of agriculturists have a favorite binder to harvest their crops, and they can explain why they prefer that particular machine. Among the many exclusive features of the McCormick binder, there are two things that specially appeal to every practical farmer—the improved needle and the simple knotter—and these two features materially assist in making the McCormick the favorite machine of the farmer.

There is no advice we could give a reader of HOARD'S DAIRYMAN on which we would be more certain of being right, or more certain that if accepted would prove highly satisfactory and profitable to the reader, than to advise the purchase of a Northern Wisconsin farm if you want a farm. The same money that buys a small truck farm in the settled communities will start one out with a good big farm. In going into Northern Wisconsin you are not going away from civilization. Schools and churches are near and the market conditions are really the best, having the mining interests of Northern Michigan, the growing cities on Lake Superior, St. Paul and Minneapolis on the west, and Milwaukee and Chicago to the south. If you want a larger farm than you now own or can comfortably own in your present surroundings, look into the propositions advertised in our columns. These lands are rapidly raising in value and the time to buy is now. Those who are advertising want to tell you about them; the information costs you nothing and you may make it worth thousands to you.

CARRIAGE BOOK FREE.

Every man or woman who is thinking of buying a carriage, a buggy, a set of harness or other horse accessories, should write to the Columbus Carriage and Harness Company, Columbus, Ohio, for their new illustrated booklet. This book which will be mailed free to any address, shows the advantages of buying direct from the manufacturers and doing away with the dealer's profits, thus resulting in the saving of thonsands of dollars to customers. Nothing could be fairer than the way the Columbus Carriage Company sell their goods. That they have all the confidence possible in what they manufacture is shown in the liberal way they treat their customers. If the buyer finds the carriage not as represented and unsatisfactory, he can return it to the factory, the purchase money is returned and the freight paid both ways. Whether the dealer or manufacturer is patronized, this book should be in the possession of all who are interested in the carriage question, as it will help the prospective buyer to make a choice. It not only illustrates all high grade vehicles, but shows the cost of them at the factory. Address a postal card to the Columbus Carriage Company, Columbus, Ohio, or, if you are located in some western state, address it to their St. Louis office, with a request for one.

YOU CAN SAVE MONEY.

One of the most reliable paint houses in America is O. W. Ingersoll, 258 Plymouth St., Brooklyn, N. Y. This firm has been in business for over 61 years and their paints are officially endorsed by the State Granges of Wisconsin and various other states throughout the Union. They have held this endorsement exclusively for the past 27 years. Their prices are exceedingly reasonable and they claim to save you 40 cents on every gallon of paint ordered and to furnish a paint that is twice as durable as you can get elsewhere for the money. They will be pleased to furnish you with sample cards containing 52 colors and their book entitled "Every Man His Own Painter" which tells all about paints, what to use, how to use it, etc. They will mail this to you free on request.

Farmers and stock owners who are having trouble this spring from calf scours, will be interested in the experience of Mr. C. E. Andrews of Lawrenceville, Pa., who writes as follows: "I had a valuable Durham calf taken with scours when two days old. I expected to lose him as I had many others A neighbor told me about Hood Farm Calf Scour Treatment and offered me some of the medicine until I could send for more to C. I. Hood Co., Lowell, Mass. Although I thought the calf past help, yet a few doses of Hood Farm Calf Scour Cure brought him out all right." This remedy is advertised in our columns, and put up in two sizes at $1 and $2.50. It is the most successful remedy for scours that has ever been placed on the market and is saving stock owners a great deal of money. Every cattle raiser should write to C. I. Hood Co., Lowell, Mass., for information.

In directing the attention of readers to the advertisement of the John M. Cannon Land Agency, Cresco, Iowa, we hope to put some anxious seekers in touch with some of the good farms still to be had in various parts of the country. This agency has an "improved farm" list at what seems very attractive prices. It is not by any means limited to the state of Iowa, but makes a specialty of long range sales, wherever desirable farms are on the market. A reliable man in the land business furnishes the only satisfactory means of locating desirable farms these days. The Cannon Agency is a reliable one and very thoroughly covers the territory. Farm hunters will profit by giving the ad. attention. It is headed 'Iowa Farms for Sale."

On Wednesday evening, the twenty-second instant, The Standard Paint Company, manufacturers of the well-known Ruberoid Roofing and P. & B. products, tendered to its employees a "house-warming" in celebration of the completion of their new factory at Bound Brook, N. J. There were present some six hundred people, including the employees of the company and their friends. They danced until the small hours, being in the meantime regaled with plentiful refreshments, in an immense room some three hundred and fifty to three hundred and seventy-five feet long on the third floor of the new building. The visitors from New York and neighboring New Jersey towns were very numerous, and all departed expressing an ardent wish that The Standard Paint Company might soon again enlarge its plant that they might enjoy another "house-warming." The Standard Paint Company was organized in 1886 The first factory was erected at Bound Brook, N. J., on a part of the sight of the present works. The Standard Paint Company were the first to place upon the market Ready Roofing (Ruberoid) which was odorless, weather-proof and elastic. In view of the unapproachable quality of these manufactures it was but natural that the demand should be enormous. This demand has so steadily increased as to grow beyond the capacity of the works, and extensions of the plant and purchases of additional land have

ILLUSTRATION.

RIGHT VEHICLES AT RIGHT PRICES.

Time was when to afford one's self a neat, comfortable and serviceable conveyance meant an expenditure of from $125 to $250. The family carriage or the young man's buggy was then a luxury to be enjoyed by but few. But times have changed in this regard. If one but gets into the proper buying channels so that he avoids payment of cumulative profits to jobber, dealer and agent, in other words, buys from a well established, reputable concern which makes shipments direct from the factory to the user, a first-class vehicle is within easy reach of every one who can lay any claim to being well to do. Old time exorbitant prices are still prevalent in many quarters. They are a necessity where goods pass through so many people's hands and must be made to pay so many profits. But happily now purchasers are not compelled to pay them. There are other places to buy, getting the same quality of goods at great reduction in price. A vehicle concern such as we have in mind is the Marvin Smith Company of Chicago. It is doing much to popularize the prices of all classes of good vehicles and buggies, phaetons, surreys, carriages, etc. The illustration shows a standard, well made, serviceable, stylish buggy which they are selling for $58.20. Local dealers everywhere would claim to be making a rare bargain on this same vehicle at $100. This is but one of a long line of vehicles, comprehending every purpose and style which this house is selling at such prices as readers have doubtless noted from their advertisements regularly seen in our columns. Dealers agree that by patronizing them you have the opportunity to examine and make choice before buying. This does not compensate for the high prices charged. The fact is, that the company named ships anything you may select from their complete vehicle catalogue showing many times over the varieties and styles the local dealer carries, without any payment in advance, and permits full and free examination without obligation to purchase if not satisfactory. The house is perfectly reliable. Dealing with them is as safe and practically as prompt as with local dealers. They make it possible for everyone to own a good conveyance by paying only reasonable prices. There is no necessity at this day of paying more than their prices. It does not bring better quality. We commend the house heartily to readers who have under consideration the purchase of a conveyance of any sort

Hoard's Dairyman.

been continuously necessary from the beginnning. Within the last two years the pressure upon the manufacturing facilities has been so extraordinarily great, gathering force with every month, that the Company was obliged to double its capacity.

Two forces of men have been kept working night and day, with engines working twenty-three hours out of every twenty-four and still it has been found impossible to meet demands as promptly as desired. The steady growth of the business, as above indicated, is public evidence of the place which the Company holds as manufacturers of the leading prepared Roofing and Insulating Papers.

DAIRY MARKETS.

ELGIN, Ill., May 4—Butter—Sold at 20c a lb. on the Board of Trade this afternoon, a drop of 2c from last week. Sales for this district during the week were 600,000 pounds.

CANTON, N. Y. May 2—Butter—Offered 331 and 734 tubs butter sold at 20c.

Cheese—Large cheese, 346 Twin cheese and large cheese sold at 11¼c; Twins, 11⅞c.

NEW YORK MARKET

NEW YORK, May 1st.—Butter—Receipts for the week, 36,092 packages. Exports for the week, 544 packages.

The price on extra creamery butter was dropped to 23c early in the week; on Wednesday another ½c was taken off, and today, Saturday, 22c is the top quotation. Strictly extra goods are not over plentiful, but there was more than enough of poor to good creameries which were freely offered at 1 to 2c under the top price, and there is a fair stock of this style goods going over unsold. A large proportion of the creamery butter coming from this state was quite ordinary, showing a lack of fine flavor, irregular in make and mixed in color.

New York state dairy was in light supply, we note sales of few parcels fancy Delaware tubs at 21 to 22c, and under grades at 15 to 20c. Ladle & Renovated butter quite plentiful and prices favor buyers. We quote:

Creamery, extra, 22c; medium, 20@21c; poor, 15@18c Dairy, extra, 20@21c; medium, 16@19c; poor, 12@15c.

Cheese—Receipts for the week, 21,864 boxes. Exports for the week, 8,284 boxes.

Old cheese selling in small lots at 14 to 14½c for best and 12 to 13¾c for middling qualities. Home trade bought liberally of finest, new, small cheese at 12½ to 12¾c, and exporters took all the large sizes at 12 to 12¾c, and stock is well cleaned up at the close. Skimmed cheese had a hard time this week and prices were much lower and about nominal. We quote:

Old cheese, extra, 14@14½c; medium, 12@13; poor, 10@11c. New cheese, extra, 12½@13c; medium, 11@12c; poor, 8@10c.

DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, April 30—Butter—The receipts are gradually on the increase, and the advices from the principal dairy sections indicate a further increase in the near future, with the exception of a few creameries; there is very little improvement to note in the quality; the majority of the receipts are running very irregular in quality, many lots showing unmistakable signs of stale milk, which fact renders them very undesirable. The recent softening of values has not only made buyers cautious in their purchases, but very exacting as regards quality, and this has had the tendency to widen the range of values. Held creamery is very slow sale, unless the quality is bang up. Choice imitation creamery continues rather scarce. Fresh sweet ladles are also in light supply and quotations on all desirable offerings are well sustained. Rolls, owing to the warm weather, have been coming in in bad condition; we suggest that from now on you pack them solid. Blocks and prints—The supply is fully equal to the requirements. The market closes quiet and feverish.

Eggs—After our issue of last week, a much firmer feeling developed and prices were advanced a ½ cent. So far this week, though the demand has been good, there has not been that activity that characterized the market towards the close of last; the receipts continue fairly liberal and all desirable stock has met prompt sale at 15½c. Duck eggs—While the receipts have been quite liberal, there has been no surplus, as the demand so far has been equal to the supply. Goose eggs—Dull and prices irregular.

301 Exchange Place. G. M. LAMB & BRO.

READING NOTICES.

All Reading Notices under this head are at the rate of $5 cents per line.

First-class practical dairyman, butter making, milk testing, dairy machinist, good all round man, excellent references, factory experience. age 23, wants situation. G. HUMPHREY, 2166 Fifth Ave., New York City.

For Sale Cheap--Second-hand and new engines and boilers for power in creameries or for operating corn huskers, feed grinders, etc. Address A. ZWIEBEL, JR., Burlington, Wis.

For Sale—Pure bred Guernsey bulls and grade heifers. Also Early Black Soy Beans at $2.00 per bushel. A. H. HINMAN, Neenah, Wis.

A Registered Guernsey Bull 15 months old for sale. A very fine animal. Inquire of J. S. HUNTER, Pickett, Wis. 12-tf

For Sale—Four young registered Guernsey cows, all fresh. J. E. STORY, Stanley, Wis. 11 tf

For Sale—Carload of grade Holstein springers. C. BOTTMA STOCK YARDS, Indianapolis, Ind. 13-2

For Sale—Or will trade for a Jersey bull from 18 months to 2 years old, a Rider engine for pumping water. This engine is in first class condition and is sold for no fault. We have a steam pump and have no use for it. For full particulars write E. T. SHAFFER, Polk City, Ia. 13-2

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

The Business Herd of Holstein-Friesian cows are being closed out at a great sacrifice, and if you want one or more officially tested, good business cows write at once and secure first choice. State just what you want and save time and correspondence. F G. JOHNSTON & CO., Sta. B, Columbus, O. 11-tf

Wanted—A first-class manager with experience to take entire charge of my herd of one hundred cows. Write for particulars, stating experience, age and salary expected. BOX 529, San Antonio, Texas. 11-3

Holstein-Friesian Bulls from one to fourteen months old at prices that will surprise you. O. J. GODFREY, Pennellville, N. Y. 11-tf

Berkshire Boars ready for service, for sale. Also spring pigs. Quality high, price low. GEO. V. SAFFARRANS, Palmyra, Mo. 11-2

For Sale—Tamworth boars, all ages. Write what you want. NOAH GRAY, Viola, Wis. 12-2

Barred Plymouth Rock eggs from a pen of choice hens and a fine Thompson cockerel. 15 fresh eggs for $1.00. J. BLACK, Bremen, Ohio. 11-2

For Sale at a Bargain--A few complete separator station outfits with Alphas No. 1 and 2 belt, also 20th Century steam separators at $300 to $500 each. Also a few belt separators, No. 1 Alphas, Springer, Sharples and De Lavals standards at $30.00 to $150 each. W. A. CARPENTER, York, Neb. 12 2

For Sale—De Laval separator, Alpha No 1, good as new. C. V. CRY, CO., Mechanicsburg, Pa. 12-2

Wanted—Buyer for Victor combined churn No 2, 100-gal. cream vat, 60-gal. weigh can. All the above are in A No. 1 condition, used less than 1 year. We have no use for them and will price them low to a quick buyer. For full particulars inquire of E. T. SHAFFER, Polk City, Ia. 13-2

Dairy Cows For Sale—At a bargain. Administrators will close out one of the finest herds in the state, of thoroughbred Holsteins and Jerseys, and grades, noted for milk and butter qualities Your choice of fifty head. KEWANEE DAIRY FARM, Lock Box 115, Kewanee, Ill. 13-2

Wanted—At once, a first-class herdsman and milker to take charge of a herd of 30 cows. Married man without children preferred. State price wanted and give experience when writing. Address JOHN M. ENGLAND, Callao, Mo.

For Sale—At a bargain, a large dairy farm with up-to-date and first-class improvements. Large house, 2 large barns, large silo, fully equipped creamery plant and several outbuildings. Home market for all product at prices above top of Elgin market. Would sell either with or without stock. For particulars address C. O., care Hoard's Dairyman. 13-2

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

For Sale—To settle estate, dairy farm and milk route, one and one-half miles from Manston, county seat of Juneau County, Wis. 35 cows, 200 or 280 acres as desired, with fixtures and stock. Basement barn. There is good tobacco land on this farm. Enquire of B. N. SOUTHER, Manston, Wis. Box 336. 9-5

Position Wanted — Experienced creamery manager wishes position as manager or butter maker in up-to-date creamery. Makes all by-products of milk. Taken one course at Cornell Dairy School. A No. 1 references. B. E., care Hoard's Dairyman. 11-tf

Wanted—Position as farm manager by a competent and energetic Agil College man. Married aged 30. Good references as to honesty and ability. Address 666, care of HOARD'S DAIRYMAN.

Wanted—Married man, competent to care for a dairy and work on small farm. A German with some help to milk preferred. House, garden, milk, etc. Addres BOX 46, Delafield, Wis. 13-2

Wanted—At once, expert condenser for partner. Prefer man able and willing to supply one half necessary capital. I have the raw milk at creamery and market for product in city. Address J. D. ROSZELL, 223 So. Mad., Peoria, Ill. 13-3

Wanted—Situation as foreman of creamery. Six years practical experience pasteurizing and general creamery work in model creamery of southern New York. Perfectly temperate. Address J. I. HARING, Box 36, Port Dickinson, N. Y.

For Sale—De Laval "Dairy Steam-Turbine" separator, capacity 1000 lbs. per hour, used very little, in good condition. Going out of business. Address B. F. BRUNDRED, Oil City, Pa. 13-tf

Very Low Rates to California and Return—Via the North-Western Line. First-class round-trip tickets on sale May 3d and 12th to 18th, to Los Angeles and San Francisco. Favorable limits and stop over privileges and choice of routes. The overland limited, most luxurious train in the world, leaves Chicago daily 8:00 p. m. Less than three days en route. Drawing room and compartment sleeping cars, observation cars, dining cars, buffet-library cars, (barber and bath) electric lighted throughout. Three trains a day from Chicago to the coast through without change. Daily and personally conducted tourist car excursions to California, Washington or Oregon. For particulars apply to ticket agents Chicago & North-Western R'y. 8-7

To Colorado in 1903—The passenger department of the Chicago & North-Western Railway has issued a very interesting folder, giving information as to reduced rates and sleeping car service, with a short description of the various points of interest in Colorado usually visited by tourists, these excursion rates applying on account of the Christian Endeavor meeting to be held at Denver, July 9th to 13th. Send 2-cent stamp for copy, to W. B. KNISKERN, Passenger Traffic Manager, Chicago. 9-6

A Wisconsin Herd Report.

ED. HOARD'S DAIRYMAN:—The following is the record of my herd for the year 1902:

1902	Lbs. milk.	Test.	Lbs. butter fat.	Price cents	Amount.	Butter used	Cash.
January	7619	4.9	373	24	$89.52	$1.44	$88.08
February	6502	4.8	312	26½	82.68	1.62	81.06
March	6358	4.8	305	26	79.30	2.86	76.44
April	5330	4.8	256	24	61.44	3.19	58.25
May	5672	4.7	266	20⅓	54.53	1.89	52.64
June	4919	4.7	231	20	46.20	2.94	43.26
July	3661	4.7	172	19	32.68	3.40	29.28
August	3245	4.6	149	18	26.82	3.61	23.21
September	7308	4.6	336	20½	68 38	2 52	65.86
October	6735	4.6	310	22½	69.75	3.64	66.11

December	5955	4.6	274	28	76.72	.84	75.88
Total	69565	4.7	3272	22 11-12	$762.90	$31.85	$731.05

Per one hundred lbs. milk $1.09 6⅘ mills.
There were 14 cows in milk, per cow, cash $54.49⅓.
Each cow gave 4969 lbs. of milk.
Our average per lb. of butter fat, 23⅓ cents.

Mayville, Wis. H. W. SCHELLPFEFFER.

Selections from the New York Farmer's Institutes.

ED. HOARD'S DAIRYMAN:—Following are some selections from the New York institutes.

Address by the Hon. D. P. Witter, of Berkshire, N. Y., on Feeding the Soil: He said feeding the soil is the foundation of agriculture. The soil is decomposed rock and vegetable matter. The best muck soils contain about 50 per cent vegetable matter. The vegetable matter comes by the growing of plants in it, which by decaying supply it with humus. We have exhausted a part of the humus by growing crops, and we have to consider the question of renewing the supply. The process of cultivation in growing crops exhausts this humus in the soil. We need to learn from nature the way to supply the soil with humus, which holds the plant food, and the water which is the vehicle which carries the food through its structure. First we can supply humus and plant food by feeding the crops we can grow to animals on the farm, and saving and applying all the manure without loss. Then we can supply humus by growing and plowing under green crops. Always try to keep something growing on the soil. Grow such catch crops as you can, clover, if you can grow it—or rye, and keep the soil covered during the winter months. Try to follow nature in keeping the soil fertile. Our last resort, in feeding the soil, should be commercial fertilizers. The best way is to feed the plant through the animal. Sometimes commercial fertilizers are desirable as a starter for plants, or to supplement the manure we are unable to get.

Geo. W. Cavanaugh of Cornell University, gave an address on the "Composition of Feeds." He spoke of the adulteration of cattle foods, such as are made by mixing oat hulls with corn meal and selling the feed for corn and oats; also by mixing ground corn cob with wheat bran. You now have a right to demand of the dealer in feed a guaranteed analysis of what the feed contains, excepting the whole ground grains. The word protein in the analysis means that portion of the food that makes the blood and muscles in the body, and the casein in the milk. The most of the feeds on the farm are lacking in protein, which is the most costly element. It is the carbohydrates in the food that make heat and fat in the body. Carbohydrates include sugar and starch. This part will not make any blood, muscle, or bone. Then we need in the food, the parts which make the bone. This is the ash, or mineral part. Speaking of some of the stock foods put up in small packages, he said: The basis of all of them is linseed meal or wheat feed, cheyene, common salt, charcoal, fenugreek, saltpetre, etc. These may be good, but they cost too much. They cost 12 cents or more per pound and they can be made for 2 to 4 cents per pound. The balanced ration is that which contains for each pound of protein 5½ to 6½ pounds of carbohydrates, or starch and sugar. The animal can use protein to an extent, to take the place of carbohydrates, but it can not use carbohydrates in the place of protein, so it is more economical to put the right amount of them in the rations.

Dr. P. Witter spoke on the "Practice of Feeding Animals." He said the cow in milk needs 2½ pounds of digestible protein and 13 4-10 pounds of carbohydrates in 24 hours. All the experiments which have been made, have verified these figures. This makes a ration with a ratio of 1 part protein to 5½ of the carbohydrates. Economical feeding is to make up the ration by obtaining these elements in their cheapest form. We take what is grown on the farm as a basis, then buy what we need to make up the balanced ration. One thing we must take into consideration is the succulence of the ration. This succulence we get in corn ensilage, which is the cheapest form in which we can supply the starch portion of the ration. Bulletins giving the analysis of different foods, and directions for making up rations, can be obtained from the New York Experiment Station at Geneva, or Cornell University.

The following questions were asked and answered at this meeting:

Is a watering trough in the barn a good investment?

Mr. Cook—I think so. I know that I have increased the quantity of milk per cow by being able to water cows in the barn during cold weather. Once when the water supply failed on a cold day, and we turned the cows out of doors, there was a considerable decrease on the quantity of milk.

What grain is best to feed a one-year-old colt?

Mr. Witter—Wheat bran is excellent, also a little linseed meal, to feed with timothy hay. I would feed a little corn meal with clover hay.

What is the value of sorghum?

Mr. Witter—Not equal to corn to grow for the cows.

Shall we dehorn the cows?

Mr. Witter—Yes, the cows will do better with them off, and there is no danger from injury. It can be done quite humanely. The best way is to stop them growing on the young calves by rubbing caustic potash on the buttons where the horns start.

Can butter fat be fed into milk?

Mr. Witter—No; when you get it up to the normal amount the cow is bred to put in her milk.

What are the best varieties of early and late strawberries?

Mr. Jenkins—Marshall, Wm. Belt and Gandy.

What is the best green food for hens?

Green clover cut, is about the best in summer for hens kept in yards. Cabbages are good for winter, also carrots and other vegetables.

What methods can you suggest to keep the young men on the farm?

Mr. Witter—Help the boy to study nature and farming as a science, and get him interested. Make the home life more attractive.

Which is the best for fowls, a ground or wood floor?

Mr. Cook—The wood floor, but better than either is the cement floor, but keep it well littered in the winter.

If hens have plenty of oyster shells, do they need bone?

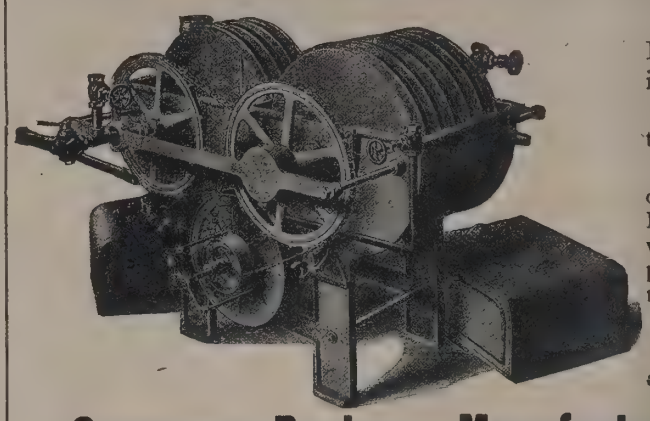
Mr. Cook—No.

What is the best kind of grit for hens in winter?

Mr. Cook—For me it is cheaper to buy the commercial or prepared grit; oyster shells do not take its place.

How does rough handling affect the dairy cow?

Mr. Witter—The nervous type of cows, like the Jerseys, are very sensitive to rough handling and the amount of butter fat is affected by the way she is treated.



Is fall plowing the best?

Mr. Witter—It depends on one's location and the crop.

Shall we try to grow alfalfa in this country?

Mr. Witter—Yes, I would experiment with it. It is the best forage plant we have. If you can grow it, you can save a large part of your grain bills. It needs a

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

WASHINGTON, D. C., May 27, 1901.

The trial of your "Purifier" made at my request, interests me very much and strengthens my conviction that this "Purifier" is an article which, if it continues to produce the results attained the present season, is destined to be of great importance and value in many dairying districts of this country.

[SIGNED] HENRY E. ALVORD,
Chief of Dairy Division, U. S. Department of Agriculture.

The use of our "MRS. LEA'S MILK AND BUTTER PURIFIER" is a necessity to producers of milk and butter when the pastures are at all infested with Garlic, Onions, Rye or Clover. It is a great saving, as the cows can be grazed, thereby saving largely in feed expenses. It always removes the taints when properly fed. The best dairies are using it largely and with profit. Try it and you will find it to your interest. For sale by The Dairymen's Supply Co., Philadelphia, Pa.; Farmers' Exchange Co, Belle Mead, N. J.; Cook & Brady, Middleton, Del; Filston Farm, Baltimore, Md.; Gardiner Dairy, Balimore, Md.

Manufactured by VIRGINIA CATTLE FOOD COMPANY, Danville, Va.
Write Us for Prices and Further Information.

deep, rich and well drained soil. Lime or ashes make the soil more congenial to alfalfa, which belongs to the clover family.

What is the best home made condition powder?

Mr. Cook advised the following formula: 100 lbs. linseed meal, 5 lbs. charcoal pulverized, 5 lbs. saltpetre, 5 lbs. Epsom salts, 3 lbs. fenugreek, 5 lbs. salt. This is as good as any you can buy and will cost about 4 cents a pound.

What is the best green crop to plow under for fertilizer?

Mr. Witter—Clover will best fertilize the soil, but I do not think we can afford to plow it under. Better feed it out to animals on the farm.

What breed of hogs is the best for the dairy farm?

Mr. Cook—The Berkshire are good, so are the Chester White and Poland China. Rape is good to grow for hogs. You can make more pork with less other food.

Will it pay to sow clover on ground that is to be plowed up the following year?

Mr. Witter—I would sow something on it, if it will grow well on your soil I would sow it, if not, I sow some other catch crop.

Which is the most profitable fowl, the brown or white Leghorns?

Mr. Cook—The value of any breed depends on the qualities that have been bred into it. I believe the White Leghorns have received the most attention as they are a larger fowl and lay larger eggs.

What about alfalfa, is it a profitable crop?

Mr. Witter—One ton of alfalfa hay contains about twice as much protein as one ton of timothy hay, and if we can grow it, it is the best forage crop we have, for 1 to 5 tons per acre is not a large yield of alfalfa. First you should have a deep, and well drained soil and it should have some lime in it. The seed bed for all alfalfa should be made very fine and about 30 pounds of seed to the acre alone with no nurse crop. Begin to mow when the plants are only a few inches high, and then after always mow before they blossom. W. H. JENKINS.

Sidney Center, N. Y.

Flooding Alfalfa Land.

ED. HOARD'S DAIRYMAN:—Last spring I sowed three or four acres of alfalfa upon land subject to overflow from the river. I have been told since, that if it is covered by water for only one day it will die. The river this year was lower than it has been for several years and failed to overflow this field, so I am without personal experience upon this point. Can you tell me if this is correct, and what effect this overflow would have if it came early, before the alfalfa had commenced putting out fresh buds or leaves?

Nashville, Tenn. J. L. C.

Those who have had experience state that water standing on alfalfa for 48 hours or over will kill the plant whether dormant or growing. Alfalfa should never be sown on land that is subject to overflow.

An Argument for Disarming Horned Cattle.

ED. HOARD'S DAIRYMAN: — At the Dublin Dairy we have come to believe in your paper. In fact we do not see why anyone who is interested in dairying should be without the DAIRYMAN. Of course, if a man knows enough already he will not need any paper, but the others do all need the DAIRYMAN, and can learn something from it.

I am glad to see that so many are becoming converts to the idea of dehorning their cattle. The man who has once tried dehorned cattle will never again be satisfied to have his cattle going around with two daggers for each cow.

Dehorned cattle are so much more easily handled, that the dairyman who has once seen a herd of dehorned cows will be sure to become a convert, unless he is so determined to stick to the old way, that new ways find no favor with him at all.

The reasons for dehorning have all been so frequently discussed that nothing need be said on this ground. To state them is to state the only conclusion.

But we have come to the conclusion that to dehorn the entire herd and not to allow any of the cattle to come into contact with armed cattle, makes a radical difference in the dispositions of the cattle of the entire herd. The difference is more marked when there are no armed cattle at all. In time, the breed of cattle so treated, would show marked characteristics. The disposition to fight, would be almost eliminated.

We have no wounded or bruised cattle. We have three bulls which run together in the same small pasture. Two of them are very gentle, and can be caught and handled and petted anywhere. The other is a little skittish, but they do not injure each other, and unless a cow happens to get near them there is entire peace among them. They stay together and take exercise day and night in the same small enclosure.

In our barn the cows are like a flock of sheep, are as gentle and as easily handled. But the dehorned cow has no place among a lot of armed cattle, and unless the dairyman is going to disarm all his cattle, it is unjust to disarm a few of them. LEE YOUNG.

Stephenville, Texas.

Without entering into the argument either for or against removing horns from dairy animals, we feel called upon to enter our most emphatic protest against handling and petting those very gentle bulls. A bull without horns, is in some respects a more dangerous animal than one with horns, and there is no telling when the most gentle of bulls will turn into the most furious and ungovernable animal.

Alfalfa in the Silo.

Two cases of silaged alfalfa have come to my notice where results have apparently been satisfactory. Cows seem to relish the food, and when fed in connection with corn silage most excellent results follow. I have not tried it. Red clover has not, in our experience, given quite the satisfactory results one would anticipate. I am, however, greatly interested in silaging alfalfa. Its merit is known as a forage and hay fodder. If we may covert it into silage the great difficulty of curing in our humid atmosphere will be avoided. I learn that the heat developed may need some attention by way of adding water freely at time of filling. I am satisfied that we are slowly gaining ground in New York and will ultimately grow it upon most farms in larger or smaller areas, according to the location, subsoil, mechanical condition, and readily available plant food in the soil, learning in the more northerly portions to give adequate winter protection, and so adding one more forage plant to save a portion of our tremendous outgo for concentrated cattle food.—H. E. COOK, in *Rural New Yorker*.

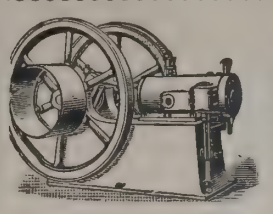
"ADVERTISEMENT"

IN CONVENTION.

Teachers Learn Something Not in The Class Book.

A number of young women attending a teachers' convention at Oklahoma City some time ago learned a valuable lesson in hygiene through a sister teacher who says: "About a year ago I had my first attack of poor health and it seemed a terrible thing to me for I had always been so well and strong. My stomach distressed me terribly; it seemed like it was raw, especially after breakfast, and it would burn and hurt me so I could not rest. I was soon convinced that it was caused by coffee drinking and at the request of a friend I gave up coffee and began to use Postum Coffee.

"The change in my condition was something marvelous. I had actually given up teaching because doctors were unable to help my stomach trouble but since I quit coffee and used Postum my troubles have disappeared and I have gone to teaching again.



"Some time ago I attended a convention at Oklahoma City and determined to have Postum at my boarding-house where there were eight other teachers, four of them suffering from coffee sickness. My landlady did not make the Postum right but I showed her how and we all found it delicious. We all drank it the rest of the time we were there and the young ladies in question felt much better and declared that their heads were much clearer for study and their general health much improved. I have their names if you care for them." Names furnished by Postum Co., Battle Creek, Mich.

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our Volume Governor gives uniform speed. Our Aome Mixer is the most positive and economical on the market. Our Hand Starting Lever starts engine with least effort. All bearings of Phosphor Bronze. Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

Criticisms Criticised.

Farm Separators and Cream Quality.

ED. HOARD'S DAIRYMAN:—In your issue of March 20th, I note an article under the heading, "Vicious Hand Separator Advertising," in which an Indiana writer, who hides his identity under the *nom de plume* "G. S.," attacks the hand separator manufacturers on the ground that their advertising misrepresents the facts about the delivery of hand separator cream to the creamery.

The simple fact is, G. S. does not know what he is writing about. He appears to have a theory of operating an old-style creamery, and that is about as far along as he has gone in the butter manufacturing business. His theory is based on what he has heard about the delivery of milk at the creamery, with the washcloth or a bar of soap, or something worse, in the bottom of the can, or an odor of the pig pen, and can slime (ropy milk) when the milk is turned out. From this theory of handling milk G. S. has jumped to the conclusion that cream from a farm separator cannot be handled so as to be in good condition for butter making, if delivery is made only twice each week.

The theory propounded by G. S. appears so absurd in the face of our three years' experience in making butter from hand separator cream that we are more than surprised that such "hog wash" should slip into print past the usually watchful eye of the editor of HOARD'S DAIRYMAN.

In the first place, the article is manifestly unjust to the booklet, "The Hole in the Bucket," and to the Empire Cream Separator Company, who issued this booklet. The attempt seems to be made in the article to fasten on the booklet the advocacy of washing a separator but once a day, when in truth, cleanliness, absolute cleanliness, is one of the strongest points of the Empire advertisements and the Empire agent's talk. The Empire company has always taken the position that good cream can be produced only by a machine with a simple bowl, capable of easy washing. This has been one of their strongest arguments in favor of their machine, and in their advertisements, they have at all times contrasted their easily washed bowl with the complicated bowl of other types, which the Empire company claims is impossible to keep clean.

In regard to the special sentence of criticism, involving the frequency of delivery of cream to the creamery, I can say that in the past three years my creamery has been in receipt of from 100 to 500 cans of hand separator cream daily, which has been made into butter under my own supervision. And I challenge any old style creamery to show a better average of WesternExtras than stand to the credit of the Hygeia Creamery Company of Omaha. I have personally inspected thousands of cans of cream which have to come to my creamery from the surrounding country, some of it having travelled over 300 miles by rail to reach the creamery, and at every season of the year, and I must say the average fitness of that cream for butter making is fully equal to the average milk furnished the old style creamery and infinitely better than the cream we used to get in the old time gathered cream creamery with which I was connected for several years.

If "G. S." will investigate the situation, he will find that if a creameryman is receiving a poor quality of cream from hand separator patrons, it is entirely the creameryman's fault. He is either supplying his patrons with a poor separator, or he has not properly instructed them in its use. If he does this, a semi-weekly delivery is all that is really necessary a greater portion of the year. Every patron of the Hygeia Creamery Company, for example, is instructed to cool his cream to the temperature of well water before he sets it away. He is instructed to keep his separator clean, and to cool each new skimming before adding it to the can; to thoroughly stir the old and new cream together when they are mixed; to cover the cream can with a proper cloth cover to exclude insects and dust, only while holding the cream for shipment, instead of covering it tightly with the can cover; he is instructed how to keep the cream cool even in the hottest weather by the simple method of surrounding it with plenty of cold water.

I am bound to say in behalf of the hundreds of Nebraska and Iowa farmers from whom we buy hand separator cream that the known result of their work proves that they follow out our instructions remarkably well. The condition of the hand separator cream as it reaches this factory on twice-a-week deliveries averages remarkably good.

I attribute the high quality of the cream received largely to another factor, however; "G. S." and all the out-of-date dairymen forget that the hand separator so reduces the drudgery of dairying and increases the profits that those who buy the separators, experience an enthusiasm for their work that they never felt before. This gives them zeal in carrying out details of the work that has not heretofore been reached by any system. Add to this the fact that the small bulk of cream, where it is skimmed to 40 per cent fat, is easy to care for properly as compared with whole milk handled by any system, and the good condition of hand separator cream is fairly accounted for.

From our point of view, and we look directly from the dollars-and-cents-hilltop, it is sound dairy wisdom to point out the "hole in the bucket when the dairyman makes a trip to the creamery every day instead of twice a week."

It is true, as we may infer from "Green Shucks" letter, that separator manufacturers are hustling for business. That is not, however, from "over-anxiety" of any sort, but merely from the fact that the wide-awake separator manufacturers are young pushers in business. "Hasbeens" of the "G. S." sort cannot understand such people. And speaking for the Empire Separator people of Bloomfield, N. J., at least,—of whose affairs I know something—they have no "over-anxiety" of any sort, except to build machines fast enough to meet the demand. I do know, however, and I believe every one who is at all familiar with the separator proposition will admit, that in the past three years the Empire Cream Separator Company has done more to advance the cause of better dairying than all other separator companies combined. Their newspaper advertising has been free from mud-slinging. Their booklets and circulars have been conservative in statement and educational in tone. They have consistently labored with advanced dairymen to elevate the standard of dairy excellency, and in this work they have been a notable exception to the average run of separator manufacturers. They deserve the thanks of every man concerned in the best interest of the industry.

"G. S." cannot stay the hand of dairy progress by his little dash of cold water flung at separator manufacturers. We predict that it will only be a very little time till there will be as many hand separators as mowing machines in use, and the length of time seems now limited only by the factory's capacity.

"G. S." and the rest may well cease to exert "constant effort" toward "educating the farmers to produce a first-class article in the way of milk or cream" by old methods. I worked at that a dozen years. It has failed, generally. The old method has in it so much hard work, and is so unprofitable to the farmer that it does not enlist his enthusiam. These buttermakers might better spend a little time "educating" themselves. Let them welcome the incoming of the hand separator by buying the cream at a fair valuation of its butter fat content. Then get a pasteurizing plant and with modern machinery throughout in the creamery,

BILTMORE FARMS,
BILTMORE, N. C.

MUST BE
SACRIFICED
Having concluded to retire from the dairy business, and having sold my farm, possession to be given in sixty days, I offer for sale my herd of cows at a price around half real value. I have
20 COWS AND A BULL
bought at H. G. McMillan sale at prices ranging from $70 to $150 each. I have five coming two-year-old heifers in calf by Trustee's Gold. These cattle have rich strain of Diploma, Brown Bessie, and St. Lambert blood. They are heavy milkers, and average annual test of the entire herd is nearly 6 per cent. In size, beauty, and performance at the pail there is nothing like them. I will take $70 per head and give 12 months' time on a good note at 6 per cent.
Also have a Sharples Hand Separator, 700 lbs. capacity, cost $150.00, used very little and will sell for $50.00; a Fodder Cutter, mounted, cost $220.00, capacity 12 tons per hour, used only five days, sell for $100 00; one Gasolene Engine, "Jack of All Trades," 1½ horse power, one year old, cost $128, price $65.00. B. C. WELCH, Elsberry, Mo.

HAZEL FERN HERD. A. J. C. C. Jerseys, blood of St. Lambert, Melia Ann, Combination, Pedro, Golden Ladd. A. G. C. C. Guernseys, Registered Berkshires. Inspection and correspondence invited. Young things, both sexes, for sale. Estate W. S. Ladd, Portland, Oregon.

FOR SALE AT FARMER'S PRICES.
One St. Lambert bull ten months old; also bull calf three months old or will exchange for as well bred heifers. Registered Poland China pigs for sale at all times. Correspondence solicited. FRANK SHADBOLT Caledonia, Minn.

FOR SALE. Grandsons of Pedro 3187, by his son Pedro's Pretty Pogis 33660, A. J. C. C. a prize winner at Chicago World's Fair, and at Wis. and Minn. State and La Crosse Inter-State Fairs. J. Q. EMERY & SON, Albion, Wis

and a butter maker who knows how to handle bacterial cultures and manipulate the product of the churn, no anxiety need be felt about the "edge" whether it shall be "gilt" or otherwise. This is our method, and we grade above "Western Extras" often enough to make us believe our hand separator butter from twice-a-week, delivery hand-separator cream, has a good deal of gilt quality, "G. S." and other croakers to the contrary notwithstanding.

Omaha, Neb. CHAS. HARDING.

Type in Dairy Cows.

I would like to heartily endorse the sentiments of the article in your March 2nd issue, page 207, "Form as an indication of dairy propensities." We hear the trash argument that type has not anything to do with performance, coming from the beef breeders, and very seldom from a dairyman.

My experience is, that type is all we have to go by, and I firmly believe that I can take Jerseys and in twenty-five years' selection for beef points, breed them to the perfect beef form of the Durham, and in the same time can breed the Durham to the perfect dairy type of the Jersey, simply by selection and nicking.

If we cannot judge from type, we have nothing to go by. I have had fifteen years' experience in dairying, and I find that every time we try to couple the beef qualities with the dairy we lose in the production, and when the beef men breed their cattle to dairy production they lose their perfect beef type.

I am also confident that a man is just as big a fool to waste good feed on a dairy animal to make beef as he is to waste good feed on a beef animal to make dairy products, and the only person that needs a general-purpose cow is a general-purpose man.—EDGAR SILCOX, in *Farmers' Advocate.*

GOOD ADVICE.

Here is the advice that President Newman of the Illinois Dairymen's Association sends out. Note the facts he bases his advice on:

"In Mr. Glover's work of testing and and keeping records for one year of over 300 cows he finds the extremes to be: One cow charged $2.07 to make 100 lbs. of milk, 52 cents for 1 lb. of butter fat. The best cow 29 cents for 100 lbs. of milk or 6 and 6 tenths cents per pound of butter fat. H. B. Gurler's herd averaged a net profit of $26 per head, over and above cost of feed.

Dairymen study these figures and then weed out the poor, unprofitable cows and take better care and feed a more *balanced* ration to those that pay a profit."

AN old subscriber, Mr. D. J. Griffith, Sauquoit, N. Y., writes us to renew his subscription and says:

"Our farmers are very slow about getting out of the old ruts, which their grandfathers made for them. I have found your paper to be of great value to me. From reading the balanced rations as given in its columns, I have been able to fix one that seems to exactly fit my case."

SHADY NOOK HERD Holstein Friesians
Offers three bulls one year old. O. I. C. White Pigs, both sexes.
W. R. GATES, Fort Atkinson, Wis.

BROTHERTOWN Stock Farms
DEANSBORO, N. Y.

Some 200 Head, Male and Female, at Auction on
JUNE 4th.,

the day following the annual meeting of the Holstein-Friesian Association of America at the Yates Hotel, Syracuse, N. Y.

This herd is one of the largest in the U. S. and contains the **largest number of officially tested cows in the world.** There will be no culling out nor any private sales made before day of sale, the **entire herd will be sold without reserve,** the offer will contain males and females of all ages.

This is the largest and choicest herd of Holstein Cattle ever offered to the public and are too well known to offer any comment on same.

Among the noted sires to be sold are **A. & G. Butter King, De Kol Burke, Prince Pietertje De Kol, Almeda, Luecke 2nd Pietertje De Kol, A. & G. Netherland Piebe De Kol and sons and daughters of their get,** and a number of choice bred young bulls fit for service and from dams with large official records.

The sale will be held at the Yates Hotel Farm at Fairmount, only 15 minutes from the city. Catalogues will be ready May 15, and can be had by addressing Yates Hotel, Syracuse, or the Gregorian Hotel, New York.

AVERILL & GREGORY.

YOUNG BULLS BY THE
POPULAR HOLSTEIN SIRES
IN A POPULAR HOLSTEIN HERD.
De Kol 2d's Mutual Paul, No. 25700 H. F., Dam De Kol 2d., Sadie Vale Concordia's Paul De Kol, No. 27392, H. F. Dam Sadie Vale Concordia. If you are familiar with the official work and records of these two pre-eminent cows, you are also familiar with the fact and the desire that one of their grandsons should head your herd to insure its success. Prices so reasonable too. That's all.
Geo. F. Carter, 126 North Salina St., Syracuse, N. Y.

LOOK HERE.
34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul DeKol, or Sir Ormsby DeKol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days, average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd? McGEOCH HERD is located at Lake Mills, Wis., 56 miles west of Milwaukee. For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis. Residence: National Ave. near 40th. Phone, South 1601.

A. R. O. Stock For Sale.
Both sexes, all ages. Herd headed by Sir Piebe Hengeveld De Kol, No. 27929, dam Piebe Laura A. R. O., 21 lbs. 8 oz. Average percent fat 4.62. Eight official records in pedigree that average 23 lbs. 5 oz Frank B. Fargo, Lake Mills, Wis.

FOR SALE.
2 H. F. Bull Calves, 6 months old. Sired by Johanna Aaggie's Paul DeKol 23443, (160 A. R.) from good milkers and testers.
M. S. CAMPBELL, Genoa. DeKalk Co., Ill.

MONONA FARM Offers for sale a few well bred Holstein-Friesian Bull Calves. Also two Service Bulls at reasonable prices. The Monona Farm Herd is founded on the best stock of the De Kol, Netherland, and Clothilde families. Pense Johanna 29332 the head of the herd has 7 A. R. O. dams averaging 22 lbs. 3.7 oz. Junior sire Paul Calamity De Kol 31095.
MADISON, WIS.
THE MONONA FARM HERD.
Address, F. W. ALLIS, Madison, Wis.

.....YOU MAY.....
BEGIN AT THE HEAD
to improve your dairy herd with a bull whose dam has official record of 18 lbs. 6.3 oz., sires dam 20 lbs. 8.8 oz. Individual right. Price Right.
McKAY BROS., Buckingham, Iowa.

WOODLAKE HERD.
Advanced registry Holstein-Friesians of leading families at reasonable prices. Small calves of both sexes cheap. JOHN B. IRWIN Station D., R. 1, Minneapolis, Minn.

THE STEVENS HERD OFFERS ONE DOZEN YEARLING
HOLSTEIN HEIFERS
at greatly reduced prices, owing to lack of pasturage—choice individuals, and bred in popular lines; also a few special bargains in bull calves, while they last. Write us just what you want.
HENRY STEVENS & SON,
Brookside Stock Farm. Lacona, N. Y. (Box 208)

Patrons' Investigation at a Co-Operative Creamery in Maine.

ED. HOARD'S DAIRYMAN:—Following is the conclusion of my report:

No. 72—Farm consists of tillage, 40; pasture, 75; woodland, 15 acres; no regular orchard; about 15 scattered apple trees; sweet corn, potatoes and mixed grain are principal crops; pasture is permanent. Herd consists of 8 cows on average, one bull and a few growing heifers; none registered; average milk period is 10 months; never has kept a milk record, or made tests of quality, and has no silo. (There are revelations ahead of this patron in these lines, and he writes like one who will investigate and know for himself when he has an incentive for doing so.—F. E. E.)

Cows receive mixed grain on full feed. Corn costs $1.40 per cwt; uses cotton seed meal in mixtures; is too conservative to venture an estimate on cost of food or income from cream when no records have been made to base them on; has fed some grain on pasture; this was bran or mixed grain; turns cows to pasture May 20 to June 1st, and sometimes grazes fields after crops are harvested.

Never has tried soiling, and keeps up the herd by raising calves; tries to improve herd by raising heifers from good cows. Evidently has not yet come to the perplexing problem of just how much, or what to use to make the ration "balance." Feeds only two or three spring pigs a year, and sells skim milk for cooking, at two cents per quart. (If cost to retail is not too great, this is a good price to realize for skim milk, and is put to good use.—F. E. E.)

No. 73—Farm consists of tillage, 50; pasture, 15; woodland, 10 acres; an orchard of 5 acres contains 225 trees; principal crops are corn, grain, hay, potatoes and onions; rotation is corn, grain, potatoes and grass; pasture is permanent. Herd consists of 8 cows, 1 bull, 3 heifers, all unregistered Jerseys; milking period is 11 months; records of yield of milk from each cow are kept; tests are made to learn which cows do or do not pay for feed.

No silo has been added to this patron's buildings yet. Cows receive a grain ration made up of the following in proportions given by weight: Corn, cob and oat meal, 100 lbs.; wheat bran, 25 lbs.; cotton seed meal, 50 lbs. On full feed 12 lbs. per day are allowed each cow. Present prices are: Wheat bran, $1.10, and cotton seed meal, $1.50 per cwt.; oats, 45 cents, and corn, 55 cents per bushel.

Income from cream per cow is estimated at $75 per cow per year. As high as 5 lbs. cotton seed meal and bran are fed on pasture at times. Cows are on pasture from May 15th to November 1st. Mowing fields are not pastured. Soiling is practiced. Oats and peas, corn fodder and late-sown barley are used. The herd is increasing and improving by raising calves from "producing" cows and good bulls, and by records and testing, culling out the herd. As to balanced rations, this patron says he uses no fixed rule, but tries to feed so as to give them (the cows) all the nutrients needed for milk production.

Skim milk is fed to calves and pigs, and it is valued at 15 cents per 100 lbs. for such use. About six Berskshire and O. I C. pigs are fed each year. This patron has had a year's training in an agricultural college, and at least one other represents the short course in the State University.

Reports are probably all received, as some time has elapsed since the last one came to hand. The number received is about 30 per cent of the active patrons of

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

A. H. REID, 30th and Market Sts., Philadelphia, Pa.

YOU DO THE TESTING

on your own farm and make sure you have a bargain and a money maker, when you buy the

AMERICAN CREAM SEPARATOR.

A friend to every man who owns a cow. A machine that is sold on its merits at a surprisingly low price. Get in touch with us. Write for our catalogue. It Is Free.

American Separator Company,

Won Medal at Paris in 1900. Box 1023 Bainbridge, N. Y.

THE Iowa Dairy Separator.

AN UP-TO-DATE MACHINE REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

SEND FOR CATALOGUE NO. 60 AND PRINTED MATTER.

IOWA DAIRY SEPARATOR COMPANY, WATERLOO, IOWA.

A Valuable Cow

You can add value to any cow with a

National Hand Separator

because it will save over 80 per cent. of the loss resulting from the old method of setting. It will separate warm or cold milk, light or heavy cream, and skim *clean*. We send the National and let it prove its worth right in your own home dairy.

10 DAYS' USE FREE.

Costs nothing if you don't buy—costs nothing if you do, for it pays its cost in what it saves. Send for catalogue.

National Dairy Machine Co. Newark, N.J.

No farmer or dairyman can afford to be without one.

TEN DAYS FREE TRIAL

THE ECLIPSE Cream Separator

We want to send you an *Eclipse Cream Separator* to try. It is built double strength all through and will last and work perfectly for a life-time. It acts twice on the milk and skims it absolutely clean. Its interior device is simple, easy to wash and to operate. Its double process removes filth from the milk as well as separating the cream, and leaves both pure and sweet and fresh. It never gets out of order. It is guaranteed.

PRICE $30 UP.

It's a money maker and a money saver. It operates by hand, foot or motor power.

E. L. CHAPMAN CREAM SEPARATOR WORKS, ERIE, PA.

A CHANCE TO MAKE MONEY

I have berries, grapes and peaches a year old, fresh as when picked. I used the California Cold Process. Do not heat or seal the fruit, just put it up cold, keeps perfectly fresh, and costs almost nothing; can put up a bushel in 10 minutes. Last year I sold directions to over 120 families in one week; anyone will pay a dollar for directions when they see the beautiful samples of fruit. As there are many people poor like myself, I consider it my duty to give my experience to such and feel confident anyone can make one or two hundred dollars round home in a few days. I will mail sample of fruit and full directions to any of your readers for nineteen (19) 2-cent stamps, which is only the actual cost of the samples, postage, etc. FRANCIS CASEY, St. Louis, Mo.

S. C. SULLIVAN, 425 W. 4th., Erie, Pa.

the creamery. Several reports are from patrons of former years who do not seem to have furnished any cream for the year 1902 as evidenced by the records for March, June, September and December, which have been placed at our disposal, and from which have been drawn the figures for "cream furnished," "per cent of fat," "pounds of fat," "cents paid per pound" and "monthly cash received," also the "average estimated income per cow."

The estimated income per cow has been calculated from the average income for the four months named above. In several cases this average has been so high that it makes the income appear larger than is quite probable. It is, however, the closest estimate we can get to facts.

In case of the following patrons the records show quite too small an income to be accepted as nearly complete. These are Nos. 3, 7, 9, 10, 11, 17, 19, 20, 23, 25, 28, 33, 34, 35, 36, 40, 44, 45, 47, 49, 51, 53, 55, 58, 59, 60, 65 and 66. It is probable from a study of the data that during one or more of the record months several cows were dry and the records were reduced, which would act to make the yearly estimated yield too low, but there are evidences that some of these patrons were also selling milk or engaged in farm butter making, which side issues were not asked or reported. We would look to these sources for explanation of the low estimates for patrons Nos. 45, 49, 51, 53 and 55, and perhaps some others listed above. The patron's estimate of income per year from each cow is high enough in some of these cases to support the view that only surplus milk is creamed for the factory.

If these views are in error some of these patrons should at once set about raising the standard of production as suggested in former papers. Most of them can find improvement in keeping records of milk and testing individual cows and a study of feeding cows.

In a few cases our estimate probably exceeds the real production from all the cows having been milking during the month used as a base for the estimate, and none at a low point of production. These show even and rather large records. Nos. 5, 11, 24 and 61 may be cited as those most likely to have been overestimated thus.

In other cases it is gratifying to see the patrons' estimates so nearly substantiated by the estimates drawn from the records; also to find there can be a fair margin above cost of feeding the cows. In no case is this too high, and in few cases so high as it can be made by careful feeding, tests, records and culling the cows in accordance with the results found from these farm records.

FRANK E. EMERY.

Raise Your Own Cow Feed

For the last few years commercial cow feeds, such as bran, gluten feed, cotton seed meal, oil meal and middlings have been very high in price. Last year they were particularly so. This has discouraged many dairymen from buying them. A few years ago almost every dairyman in southern Wisconsin was buying some of these feeds. Bran used to come into Ft. Atkinson, Wis., by the train load, and dairymen bought it by the carload. The consequence was that the cows produced bountifully. According to a "cow census" of the creamery patrons, the cows of Jefferson county averaged 240 pounds of butter each; but now the returns from the creameries show a great falling off per cow. Not one-half of the dairymen of the county bought any of these feeds last year. They say they cannot afford to buy feed; that it takes all the profit to do so, and so they feed what they raise on the farm and take what they can get out of it.

In my opinion a good dairyman with good cows can still afford to buy commercial protein feeds and by so doing largely increase his profits. But if he can raise the proper feeds on his farm at a less expense than he can buy them, then he surely should do so. In my opinion the farmer can raise these protein feeds. In many parts of Wisconsin, and the West, Canada field peas do finely, and these, sown with oats, one and a half bushels of each to the acre, and cut for hay when the peas are about fit for table use, make a hay with about 9 per cent protein, which, with corn and oats, will make an excellent ration. Cow peas have been tried to a limited extent and in some cases have done well. They will furnish protein.

Clover hay, if cut early and well cured, makes splendid feed, and if fed with oats for the grain part of the ration makes a well balanced ration for milk cows. But when oats are as high as they were last year, a man could sell them and buy bran even at the high price it was then, and make money by the exchange. Wherever alfalfa can be raised with success this question of raising protein feeds on the farm is solved. Alfalfa hay, if cut at the proper stage, contains 11 per cent of digestible protein. If fed with corn ensilage it makes a perfectly balanced ration, one that is very palatable and nutritious. Nothing can beat it for milk production. In addition to the needed protein it has succulence, which is indispensable for greatest production. A little corn meal can be fed with it if there is not sufficient grain in the ensilage.

Alfalfa has been grown for many years in the semi-arid parts of the western states, but within the last few years has been tried on many farms in Wisconsin, Illinois, Iowa and other states where it was not formerly grown. Of late it seems to be proving a success. It seems to be rather a tender and delicate plant at start and needs special care to get it once started. But after it is well set, it appears to be very hardy and can stand almost anything except tramping on. Therefore, it will not bear pasturing much with heavy stock. Bruising the crown of the root seems to be death to it. It will stand drought better than any plant I know of. The summer of 1901 was the driest ever known in southern Wisconsin. There were several small fields of alfalfa near where I live which I watched daily. For several weeks in July and August, about the only green thing to be seen was these fields of alfalfa. Some of them were cut four times and others three times, and produced from four to six tons of the finest kind of hay to the acre, during the season. Ex-Governor Hoard has now about forty acres in alfalfa. Last winter his cows were fed on alfalfa hay and ensilage with a very little bran, and there is no herd of cows in this part of the country that produced as well as his. A catch of the alfalfa can be had when the season is so dry that a catch of clover cannot be obtained. This was proved in 1901. It is best to sow it by itself on good, well-prepared land as early as possible in the spring. Sow thirty pounds to the acre. In July it will need clipping to cut off the weeds. Last summer about the first of September those who did this way cut it again and got from one to one and a half tons to the acre.—C. P. GOODRICH in *Prairie Farmer*.

Litter and Manure Carriers Approved.

ED. HOARD'S DAIRYMAN:—Please find enclosed $1.00, for which renew my subscription to your paper. I have taken HOARD'S DAIRYMAN for four years, and I also take three other farm papers, but I can safely say I glean more knowledge from your paper than from all the other three. Having derived so much benefit from notes written by subscribers, for the benefit of readers I wish to tell you of the labor I am saving myself since investing in a litter carrier, which is advertised in your paper. I would not be without it for twice its cost. H. C. SHEPHARD.

Trempealeau Co., Wis.

COMMON SENSE Calf Feeder

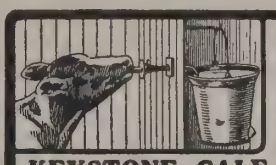
awarded Gold Medal at Pan-American Exposition. The only Feeder adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.



Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

O. H. MANUFACTURING COMPANY, DEPT. H, LYNDON, VERMONT.

SENT out under positive guarantee. Money refunded if not satisfactory. No bolting food. Perfect digestion. All tinned—no rust.

KEYSTONE CALF FEEDER

Patented under No. 721,384. Used in about forty experiment stations. Mass. Ag'l College writes as follows: Mr. M. T. Phillips, Dear Sir:—I write to say that the Calf Feeder is giving excellent satisfaction. We have found it to be all we could ask for in a feeder. It is easily cleaned and appears to be durable. Yours truly, E. A. JONES, Supt.
Complete with extra nipple, $1.50, express prepaid. Circulars free.

CHICAGO HOUSE WRECKING CO. WEST 35TH AND IRON STREETS, CHICAGO.

Rural Improvement in Canada.

Sir William McDonald and Prof. J. W. Robertson's Work.

ED. HOARD'S DAIRYMAN:—James W. Robertson, Dominion Commissioner of Agriculture and Dairying, is the moving force in one of the greatest educational projects of the day. Professor Robertson received from Sir William Macdonald, the big tobacco manufacturer of Montreal, and, proud, to say, a thirty-first cousin of the writer, and whose fathers, as mine, emigrated to Prince Edward Island, from the Western Highlands of Scotland more than a century ago.

The professor received from Sir William in 1889, the Macdonald Manual Training fund for the establishment of manual training in a number of public schools in all the provinces of Canada, and its maintenance in them as an experiment and object lesson for a period of three years. These manual training schools were opened in twenty cities, towns and villages. Forty manual training instructors were employed, and over 7,000 boys and several hundred teachers received instructions and training annually.

The manual training proved so valuable and acceptable that the Macdonald Manual Training Schools are to be continued by the provincial and local authorities in every place; and already manual training centers have been opened in twenty other towns by the regularly constituted educational authorities themselves, without any assistance from the Macdonald fund So great and salutary have been the fruits of the object lessons afforded by these training schools.

In 1899 the Canadian Professor inaugurated a plan for the improvement of crops by the systematic selection of seed grain on farms throughout the Dominion. A competition extending over three years was carried on by over 500 boys and girls. Ten thousand dollars of the MacDonald fund were devoted to prizes. The new feature of having a special plot on the farm for the growing of seed grain from seed systematically bred up by selection from the most vigorous and productive plants in each year's crop, bids fair to become a permanent feature of Canadian farming.

A further organization of means and agencies for advancing that movement is "the next big thing" on the programme.

In 1902 Prof. Robertson was entrusted by Sir William MacDonald with the MacDonald rural school fund for the improvement of education at rural schools through object lessons in the consolidation of such schools, the conveyance of children in school vans, the providing of school gardens for educational uses and the making of nature study, manual training and household science, integral parts of the course of education at elementary schools.

The MacDonald Institute and the Women's residence at the Ontario Agricultural College are being provided from that fund. These are but a few of the things Professor Robertson, in collaboration with the millionaire Montreal tobacconist, has been busy with lately.

His work as Commissioner of Agiculture and Dairying has done much to place Canada in the fore front in the production of food stuffs. His work along dairy lines, in the past year, has been mostly in the direction of the improvement of cheese curing rooms affording constant, equable, low temperature.

Ontario, Can. J. A. M.

What Certain Business Herds of Jerseys have Done in the Year 1902.

In presenting a report of the past year, concerning what had been done in testing Jersey cows, the *Jersey Bulletin* gives the following interesting report of a number of business herds of that breed.

Among the year's herd yields reported this year, one New York dairy of eight cows and four heifers yielded 4,150 lbs. bntter sold during 1901, besides furnishing a family of five. This would make an average close to, if not over, 350 lbs. per cow. Another New York herd averaged 350 lbs. butter "for everything in milk—half of them two-year-olds." A Missouri herd of 19 made 7,800 lbs. butter, an average of 410 lbs. per cow; of this, 7,589½ lbs. was sold, the price being 25 cents the year round, except in August, when it was 30 cents. An Ohio herd of fifty cows (one-third heifers) gave 262,635 lbs. milk in 1901, with an average test of 5.35 lbs. equivalent to 16,392 lbs. butter; average 327 lbs. estimated butter per cow. The milk was sold as cream and returned $5,198.50.

A Vermont herd of 20 cows (three-two-year-olds) averaged 351 lbs. butter per cow for 1901, besides supplying table of a family of six and milk for calf feeding. An Indiana herd of 35 averaged 345 lbs. butter in 1901, which was sold at 25 cents. A Georgia herd of 25 head (eight of them young heifers), gave 125,823 lbs. milk, which made 7,928 pounds butter.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Disease Among Calves.

My calves come apparently all right, and remain so for about 3 days to a week and then become droopish and refuse to suck, gradually getting weaker until they die. Sometimes will have scours, usually not. I have noticed bloody streaks in the excrements. R. L. R.
Spokane Bridge, Wash.

ANSWER

We are not able to form an opinion from the brief descrption you have given and would suggest that you describe the trouble in every detail so that we will not be compelled to guess at it, as we are liable to guess wrong if we lack the proper information and in this way will do you no good.

A Good Alterative.

What is best to give a cow to cleanse her blood?
Compton, Cal. G. Y.

ANSWER.

Give a full dose of physic and follow this with equal parts of resublimed sulphur, nitrate of potash and powdered gentian root. Mix and give a tablespoonful in food night and morning.

Off the Feed—Caked Udder.

I have a heifer calf dropped April 8th, and has been doing well until a few days ago, when it refused to eat one morning or drink milk, and has not drunk milk now for four mornings, but will drink about 5 lbs. at night. It appears healthy in every way, but froths at the mouth.

I also have a cow, one-quarter of her udder will cake about every 21 days, but I bathe it with warm lard, and it all leaves her for about 21 days, then it appears again. M. F. DEJ.
Sedalia, Mo.

ANSWER.

No. 1. Frothing at the mouth in a young calf would indicate tongue or throat trouble. Examine the mouth and you will discover the cause which must be removed.

No. 2. If this appears as regularly as you state, give the alterative recommended in the veterinary columns of this issue.

NOW IS THE TIME TO SUBSCRIBE FOR HOARD'S DAIRYMAN.

HOME-MADE SOAP

Ten pounds of the best hard soap or twenty gallons of soft soap costs just this, nothing more:

Ten minutes, almost no trouble at all, the grease or fat that you often pour down your kitchen sink (stopping up the pipes) and a can of

Banner Lye

obtainable at your grocer's for ten cents.

It is pure soap—not soap adulterated with rosin, lime clay, or other things that turn your clothes yellow or wear them out.

The New Cleanliness

Soap will take away the dirt that you see, but not the dirt that you can't see. Nothing is sure to take away this dirt but *Banner Lye*. Use it in your

☐ *Milk-pans* *Butter-tubs*
Milk-pails *Dairy*
Sink *Drains*
Cellar *Toilets*
Garbage-Pails

wherever dirt and germs collect—and your house will not only look clean, but be clean and in the best possible condition to resist disease.

Banner Lye also is a great help in washing dishes and clothes and everything else. It is odorless and colorless, easy to use, safe and cheap.

Write for book "*Uses of Banner Lye*," and give us your grocer's or druggist's name, should he not have it.

THE PENN CHEMICAL WORKS, PHILADELPHIA, U. S. A.

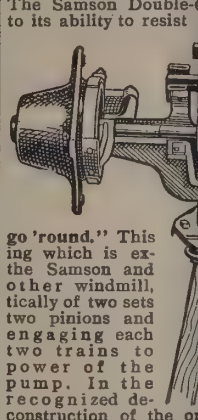

ILLUSTRATION.

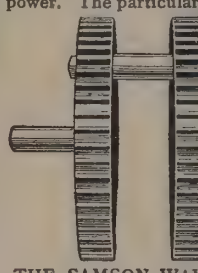
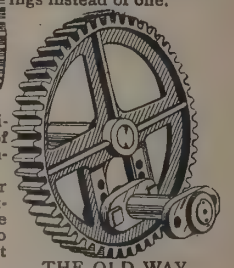
THE SAMSON WINDMILL.



At the mammoth windmill plant of the Stover Manufacturing Co., Freeport, Ill., the largest factory of its kind in the world, are made the appropriately named "Samson" windmills, strong, powerful, and storm-resisting.

While to the casual observer all windmills look alike, there is in fact a vast difference in the service rendered by and in the length of life of different makes of windmills.



The Samson Double-Gear Windmill, in addition to its ability to resist violent gales by its construction, is the one scientific wind machine built on a plan that appeals to any person whoever saw any "wheels go 'round." This double gear-ing which is exclusive with the Samson and found in no other windmill, consists practically of two sets of gearing or two spur gears two pinions and other, making engaging each transmit the two trains to wheel to the power of the light of the pump. In the effects in the recognized de-construction of the ordinary back geared windmill, the advantages attendant upon this new prinsiple employed in the Samson are manifest. The cequel shown in actual service proves the double gearing to be one of the most valuable features in the entire theory of the transmission of wind power. The particular points gained by it are:

1. More than four times the strength of any other windmill using like amount of material.
2. Distribution of burden and diminution of wear by use of four bearings instead of one.

THE SAMSON WAY

THE OLD WAY

3. The lasting qualities are double those of any other mode of construction.
4. Its center crank, or both ends of the crank-pin driven instead of one as in other makes. No chance for pin to get out or work loose.
5. The pitman and plunger operate centrally between bearings, dispensing entirely with all over-hanging and torsional strain.

There is lots more of interest to be told about the Samson, and it is told in detail in a handsome illustrated book which The Stover Mfg. Co. will be glad to send to such of our readers as are interested and will write for it.

IOWA FARMS For Sale $45 to $65 Per Acre.

We offer improved Iowa farms close to church, school and town, with local telephone and rural mail delivery, soil rich, black loam, and level, at $45 to $65 per acre. Fifteen thousand agents are showing Deering
BINDERS, HEADERS, HEADER-BINDERS, MOWERS, REAPERS, CORN BINDERS, CORN SHOCKERS, HUSKERS and SHREDDERS, KNIFE GRINDERS, BINDER TWINE, and OIL.

Purgation.

I have a young mare which had a severe attack of colic, about three weeks ago. After I got the colic under control I gave her a dose of raw linseed oil, then scouring set in and continued for almost a week, reducing her to a mere skeleton. Since then she has eaten very little. Coat dry and staring. W.
Riverside, Calif.

ANSWER.

You have evidently administered your purgatives to an excess during the attack of colic, which accounts for the scouring. Take the following: Quinine sulphate, ½ oz., dried sulphate of iron, 2 ozs.; powdered gentain root, 2 ozs.; potassium nitrate, 1½ oz mix Give a teaspoonful in food three times daily.

Nail Prick.

My horse stepped on a nail; blacksmith could not find it. He says it is in his frog. The frog is hot and the fetlock is swelled some. The horse is now very lame, and in the stable keeps the sore foot off the floor. A. P.
Brooklyn, Wis.

ANSWER

It is very imporiant to find the nail hole and follow it up, cutting it out nicely to allow the pus to escape, which will relieve the soreness. Then pour a little creolin into the opening and apply a warm linseed poultice to the entire foot. If the foot is neglected, the horse is liable to die with lock-jaw or blood poisoning.

Atrophy.

I have a small Jersey cow that dropped her second calf three weeks ago and has not been able to use her right hind leg since. No swelling. Left hip is sinking. L. E. V.
Amenia, N. D.

ANSWER.

There appears to be either a complete or partial atrophy of the main nerve trunks in this region. Have a competent veterinarian inject her with strychnine.

Emesis.

I have a heifer that throws up her feed once or twice a week. I am feeding 5 lbs. shorts per day and what clover hay and oat straw that she will eat, and what salt she cares for. L. K.
Pearson, Wash.

ANSWER.

It is advisable to change your food ration which will remove the cause.

Wart and Fibrous Tumor.

I have a cow that received a hurt on side of jaw. Place swelled up and finally broke; there is some kind of a growth that protrudes through the skin, flat on the head and about the size of the top of a tumbler. Also have a horse with some kind of swelling on elbow joint, which I think is made by shoe when she lies down. Swells up at times, breaks, and then is about the size of a base ball.
Carlisle, Pa. W. B. G.

ANSWER.

No. 1. The growth on the jaw appears to be a wart, which can be dissected out.
No. 2. The growth on elbow is a fibrous tumor, which must also be removed surgically. Employ a qualified veterinarian, who will be more able to judge by personal observation than we are.

Leucorrhoea.

I have a cow that has been in heat for two weeks. She has a whitish discharge. J. F. B.
Britt, Iowa.

ANSWER.

If the cow is with calf if is best to let her alone until she drops the calf, when the trouble will subside on its own accord.

Bloating.

Some of my cows are bloating. I lay it to the grain I feed. It consists of distillers grains, kiln-dried 5%, 35% bran, 15% corn and oats, equal parts, and am feeding about 9 lbs. daily to each cow.
Philadelphia, N. Y. W. S. K.

ANSWER.

It is possible that your kiln-dried distillers food has become mouldy in some way which would cause the bloating, or they may be eating too fast or too much at a time. Soaking or steaming it would prevent the trouble. It makes no difference whether a cow is indoors or out, when she is bloated, as long as she is not exposed to the extreme changes of weather or hot sun. Two or three ounces of hyposulphite of soda and an ounce of the tincture of ginger in a quart of warm water given as a drench will relieve the bloat.

Lameness.

One of my cows has become lame within three or four days with what is termed here blind fouls. The swelling is on the backside just above the hoof of the right hind leg. It evidently is quite painful. There is scarely any sore visible, no discharge, but is hard and feverish. E. N. R.
Franklinville, N. Y.

ANSWER.

Judging from your brief description, we conclude that your cows are suffering from foot-rot; if this is the case, you will find a slight discharge with very offensive odor between the claws. This is best remedied by applying calomel to all the moist parts at least once daily; if the swelling is not reduced in a short time, you may apply a warm linseed poultice to the parts, renewing it twice daily.

Lump Jaw.

I have a cow with a festering partroid duct About a year ago I cut it out; it seemed to heal up, but about a month ago it commenced to swell again. I cut it open; took out all the pus, but above the pus it was black flesh, like a honey comb. I cut most of the diseased parts.
Edgerton, Wis. J. G. S.

ANSWER.

Have a qualified vetrinarian dissect it out completely.

Paresis.

My neighbor has trouble with his hogs. They first get weak in hind legs, then get so they can't stand up; drop over behind, then seem to breathe hard. N. T.
Berryville, Wis.

ANSWER.

This trouble usually follows overfeeding on a continued corn diet for a long time. Remove the cause, and the trouble will be remedied.

Brain Affection.

We had a cow which we considered had some brain disease, for she would walk around in a circle and occasionally fall, for it seemed as if she could not tell where she was going. We killed her, expecting to find her brain in bad shape, but it seemed to be all right or nearly so. F. W. S.
Belleville, Mich.

ANSWER.

This trouble was caused by the presence of a parasite in the brain known as *Coenurus Cerebralis*, which has evidently escaped your eye on examination. The disease is incurable.

Mastitis.

My cow's udder is hot and badly swollen. She does not give scarcely any milk. J. H.
Medina, Ohio.

ANSWER.

Bathe the udder with hot water twice or three times daily and apply hand rubbing after each bathing until dry, then rub with equal parts of alcohol and water. Give an ounce of poke root and two ounces of potassium acetate, in a quart of water, three times daily as a drench until relieved. Usually the cause of this trouble is squeezing or bruising the udder.

Barrenness.

I had a cow freshen Nov. 7; bred her Dec. 21; she bas been in heat almost every day since; she seems to be all right every other way; good appetite. W. A. D.
Footville, Wis.

ANSWER.

There is an abnormal condition of the genitals, have her examined by a qualified veterinarian.

Hernia.

I have a nice Jersey heifer that is now about eight months old; she has an enlargement or knot beside her udder, just between the udder and her leg; it feels soft and when you press on it, it seems to disappear; as soon as I take my hand off, it appears again. Can it be rupture or what, and if it is a rupture, will that render her worthless? N. H. A.
North Carolina.

ANSWER.

Your description answers that of hernia, which may bother when she gives birth to a calf, otherwise it would not be considered dangerous. An operation is the safest remedy.

"SAVE-THE-HORSE"
—TRADE MARK—
SPAVIN CURE.
POSITIVELY AND PERMANENTLY CURES
Bone or Bog Spavin, Ringbone (except Low Ringbone) Curb, Thoroughpin, Splint, Capped Hock, Shoe Boil, Wind Puff, Weak or Strained Tendons or Lameness.

FROM A REPUTABLE AND NOTED TRAINER

GLENVILLE DRIVING PARK, CLEVELAND, OHIO.
For the enclosed $5.00 please send me one more bottle of "Save-the-Horse." It is doing great work. Respectfully, MILLARD F. SANDERS.

HARTLAND, LIVINGSTON CO., MICH.
Find enclosed money order for $5.00, for which send me another bottle of "Save-the-Horse" spavin cure as it has done all you claim for it for me With the bottle I bought of you I took off a curb, spavin, and a side bone on a 3 year old mare that other spavin cures refused to help in the least. I consider your spavin cure the best on the market. E. M. PARSHALL.

HOWICK, QUEBEC.
I had a mare suffering from a bone spavin and very lame. I concluded to try a bottle of "Save-the-Horse" and at the expiration of six week's treatment she was free from all lameness and I consider it one of the greatest compounds made. DAVID BARRINGTON.

EDGEWATER, N. J.
Enclosed find check for $5.00 for which you will kindly send me by Wells-Fargo Express one bottle of "Save-the-Horse" as soon as possible. The horse I have been treating with "Save-the-Horse" went sound and I sold him. The last I heard from this horse he was still going sound and working every day, and I think he will stay sound. The bottle I am ordering now I will use on another horse that has a pair of spavins and a curb; he does not go very lame, but walks on his toes and I think "Save-the-Horse" will bring him around so that he will walk all right. Very truly, OTTO MEYER.

The fire iron is uncertain and invariably only aggravates the disease or injury; blistering is less effective than the fire iron, and both necessitates laying up the horse from four weeks to two months. Arsenic, mercurial and poisonous compounds produce irreparable injury
"Save-the-Horse" elliminates all these factors. Horse can be worked continuously. Cures without scars, blemish, or loss of hair.
It can be applied at any time, anywhere, any place, and in all conditions and extremes of weather—hot or cold. And no matter what the age, condition or development of the case or previous failures in treating, the concentrated penetrating, absorbing power of this remedy is unfailing.
$5.00 PER BOTTLE.
Written guarantee with every bottle constructed solely to satisfy and protect you fully. Need of second bottle is almost improbable, except in rarest of cases. Copy of guarantee sent upon application.
IF YOU HAVE A CASE DIFFERENT FROM INSERTED IN OUR BOOKLET OR ADVERTISING WRITE US.
We will advise you frankly as to the possibility of the remedy effecting a cure. Give explicit particulars, give the veterinary's diagnosis, if he is competent—inform us fully as to the age, development, location of swellings, lameness, action and previous treatment.
$5.00, all druggists and dealers, or sent express prepaid.
TROY CHEMICAL CO., TROY, N. Y.

BLACKLEGOIDS

BEST PREVENTIVE OF BLACKLEG.
Blacklegoids afford the latest and best method of vaccination against blackleg—simplest, safest, surest. They are always ready for use; no filtering, measuring or mixing is necessary. Accuracy of dosage is always assured, because each Blacklegoid (or pill) is exactly sufficient for one inoculation. Administration with our Blacklegoid Injector is easy. The operation need not consume one minute. Blacklegoids are sold by druggists; *ask for them.*

ABORTION,
Retention of Placenta and Failure to Breed.
KELLOGG'S CONDITION POWDER
is a positive cure for these diseases. Write for circular containing full information, references and price.
H. W. KELLOGG COMPANY, St. Paul, Minn.

Sorghum as Hay.

A correspondent of the *Breeder's Gazette*, in telling of his experience in the growing of sorghum, as fodder, says: "I began growing it in 1893 as a soiling food in case of drouth and short pastures, and grew it for several years with no other end in view than this. I found that for this purpose there was nothing I had ever had that equaled it, as it is never killed by drouth and even with a drouth lasting for fifty days without rain, it at once sprouts into a new and vigorous growth when fall rains come. After growing it for three or four years for this purpose, I got the idea of curing it for winter feed, at first thinking I would feed it only to cattle. As we learned how to manage it we found that very large yields could be grown, and a few years later I grew eight tons to the acre, cured, from a seeding of two bushels drilled in like wheat. A year or two later I discovered that it could be packed into the mows in large bulk after it was thoroughly cured, and would keep well all winter. It was by an accident that I learned that it was a safe feed for horses, for I had feared to feed this green, juicy cane to them. A new work hand by mistake fed my horses sorghum for several days before I discovered it, and when I found that they ate it up clean, with apparently great relish, and never showed any ill effects from it, I began feeding it, and have fed it to my work horses all winter ever since. We also winter our brood sows on about a half grain ration and give them all they will eat of the sorghum. One will be surprised to see how much of it hogs will eat. Another advantage in feeding it to the hogs is that the waste, which amounts to perhaps nearly half its weight, makes one of the best bedding materials that I have ever found, being free from dust, clean, and wears much longer than straw."

16000 ...ACRES...

Of the Best Hardwood Lands in Northern Wisconsin.

They are located in Lincoln, Langlade, and Oneida counties, and only 240 miles from Milwaukee on main line of C. & N. W. R. R., Ashland Division.

These lands are especially selected and are very fine lands for dairying. The land is level, free from stone, and no soil ever produced better crops of hay, grain, and vegetables. Good roads, schools, and churches. Excellent water, both in running streams and lakes, where fishing and game abound. These lands have never before been offered on the market. Are for sale at a low price and on easy terms.

DAIRY FARM FOR SALE....

Waukesha Co., Wis., 274 acres. 125 acres under plow. 104 acres oak timber, 40 acres hay land. Good orchard, fine buildings, excellent soil; a fine dairy farm. Present owner has accommodated summer boarders There is one half mile lake frontage. Price and particulars of
HILES & MYERS, C-100 MATTHEWS BLDG., MILWAUKEE, WIS.

Buy You a Ticket to CROOKSTON, MINN., and Call upon
The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains

□ **360 acre farm,** 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

What Shall be Done with the Calves?

A Farmer's Plea for the All-Purpose Cow.

ED. HOARD'S DAIRYMAN:—I would like to ask what you do with calves in the dairy districts of Wisconsin. In this county you can't sell the calves for veal, you can't sell the steers for feeders, and it is just as hard to get rid of the extra heifers and cows of the dairy breed. Therefore we have to keep cows that will do fairly well in the dairy and that will raise a calf that will sell as a feeder, or there will be no profit in the dairy business here. W. R. ADAMS.

Kirkman, Iowa.

The dairy districts of Wisconsin have no difficulty whatever in selling their calves for veal. In some localities, and notably in the country tributary to Fort Atkinson, calf buyers are very much in evidence. It is a matter of course that very young and very small calves do not bring very large prices, but there is nothing so inferior that it will not bring from $2 to $3. The dairymen here have no difficulty in disposing of heifers that turn out poorly and cows that have outlived their usefulness, at moderately fair prices. Our dairymen feed practically all the hay and grain and coarse fodder they can raise, to their dairy cows, young stock and swine. In this way, they market on the farm and return to the soil a large proportion of the fertilizing elements which contributed to the growth of the farm products. In addition, they probably purchase enough feed for their cows to more than make up for the difference between the crops raised and the manure therefrom returned to the land.

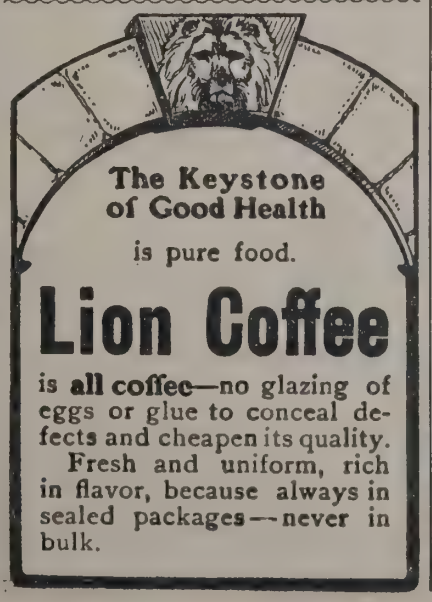
This, in a way, answers our correspondent's direct question, but we apprehend that it will not satisfy him nor any other of our readers who are wedded to the all-purpose idea.

Mr. Adams offers himself as an expert witness. He speaks as one having had experience, and, therefore, with more or less authority. If, however, he is like the average all-purpose man, he is not a competent witness. He has not had sufficient experience or observation to qualify him to speak with any authority on these subjects. He does not know what profit can be made from a dairy cow and, what is still worse, presumably he does not know what loss there usually is in feeding steers, even in Iowa, the land of cheap feeds.

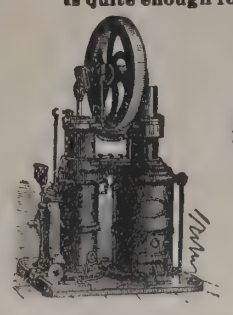
It chanced as we received Mr. Adams' letter, that there was lying upon our table a copy of the "Iowa *Homestead*," issued Jan. 8, 1903, and containing a comment or criticism on the dairy steer for beef purposes. This criticism was instigated by the fact that a dairy-bred steer won honors at the late International Stock Show in Chicago. The "*Homestead*" is not a dairy paper; all its inclinations are against the special dairy cow for the Iowa dairyman, although, like Prof. Shaw and Prof. Carlyle and some others, it can not help admitting that the special dairy cow has ability to produce milk at a lower cost than the beef animal. We cite these facts simply to show that the "*Homestead*" cannot be charged with any attempt to misinterpret the beef situation, or discourage its readers from engaging in beef production. Its argument is that there is more profit in feeding the beef steer than in feeding the dairy steer, hence, if any steers at all are kept, they should be steers of the beef type.

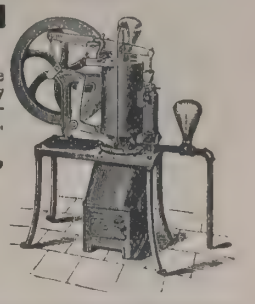
We quote from the "*Homestead's*" article as follows:

"Many experiments performed during the last few years indicate that at best the profits of feeding cattle are comparatively small, when the food consumed is reckoned at market prices. In some cases, even good feeders claim that a loss has been incurred, while few have been able to make more than $10 or $15 per head, over and above the cost of food, on their two-year-old steers. Clearly, then, if this be true, it is the last 100 or 200 lbs. that an animal puts on that makes the profit, and herein lies the great difference between the steer of the dairy type and the large, broad-backed, thick, low-down beef-maker."

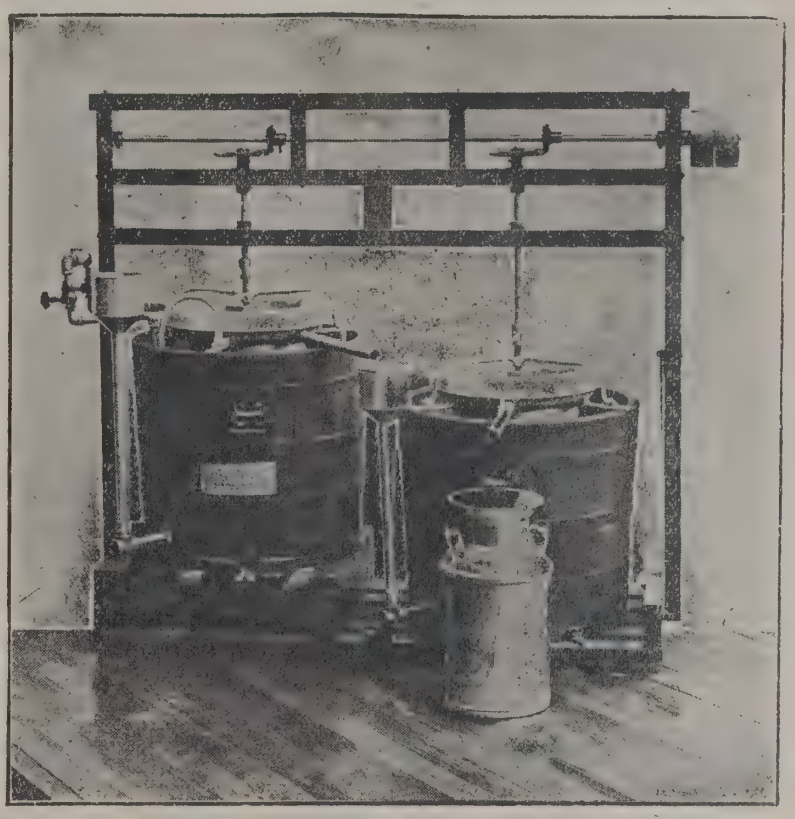


There our Iowa friend has an opinion of an expert who has canvassed the situation carefully. "At best, the profits on feeding cattle are comparatively small." "In some cases, even good breeders claim that a loss has been incurred." "Few have been able to make more than $10 or $15 per head over and above the cost of feed on their two-year-old steers."





What encouragement can Iowa farmers have from such an outlook as this! Keep a steer until he is two years old, crowd him with feed from the day of birth, then clean up a paltry profit of $10 or $15.



This is one side of the question. The other side is: what if no profit can be made by the dairyman? To this question many answers could be returned. First, it must be conceded that altogether too many dairymen make no profit at all, just as too many feeders of steers make no profit. But there are plenty of dairymen who are making not only $10 or $15 at an expense for feed not greater than the cost of raising these two-year-old steers, but are doubling, and in many instances, quadrupling that amount in net profit from their cows every year, and still have the cow for further use. In the issue of this paper for April 17, there appeared two reports from dairymen, one from Michigan and the other from Wisconsin. The Michigan dairyman milked 24 cows, of which six were heifers with first calves. These cows made 8,067 pounds of butter, or 336 pounds per cow. The total sum received for this butter was $2,077.31, an average of $86.55 for each cow in the herd. No account was taken of the value of the skim milk or the calves or for the milk and butter used in the family. On page 232, the Wisconsin dairyman reports the average amount received per cow at $64.45. This man had been keeping cows only two and one-half years and did not have either a well selected or a well bred herd, but bought as he could find them, a mixed lot. Unfortunately, he does not state and probably would not tell how much it cost him to feed these cows, but it is a very safe estimate to say that it cost less than $40 per cow, leaving him thus, at least, $25 profit for each cow, and the cow left, and no account taken as stated before of skim milk, calves or milk and butter consumed in the family.

If it be claimed that these are exceptional cases, as they probably are to a degree, let us turn to the cow census taken last fall for the Wisconsin Dairymen's Association, in a part of Fond du Lac county, Wis. This census covered 48 creamery patrons with 637 cows. The average cost of feeding per cow for the year was $29.88. The average returns for butter from creamery per cow were $35.82, the average value of butter for one-dollar's worth of feed, $1.20; average net profit from butter per cow, over cost of feed, $5.94. If to this is added the value of the skim milk at 20 cents per 100 pounds, and it was worth more than that last year because of the high price of feeds, this would add $8.40 more, making an average profit per cow of $14.34, exclusive of the calf, milk and butter used in the family.

It should not be forgotten that this was the average for 48 different herds; that among these 48 creamery patrons, there

The Keystone of Good Health
is pure food.

FARMER BRIGHTON, FAIRFIELD, IOWA.

were ten who did not get enough money from the cream to pay for the feed consumed by their cows, reckoned at current home market prices. Of these ten farmers who kept cows at a loss, about one-half kept more or less grade Short-horns, the typical all-purpose cow. The largest profit per cow returned by any herd was $29.18 from grade Guernseys and grade Jerseys. The next largest profit per cow was returned by a herd of Holsteins, $29.-79 per cow.

Here then, among these 48 dairymen, taken without selection, but as one came to them along the road, there was a net profit per cow of $14.34, almost as much average profit as the best Iowa feeders get from steers and considerably more than the next best feeders received, and at the end of the year, the cow was living and ready to repeat this performance the coming year, or possibly, do much better. If our Iowa friend cannot do as well as this average, we must conclude fault is not with the special-purpose cow.

Sorghum Silage.

ED. HOARD'S DAIRYMAN:-In reply to Mr. T. A.McD's inquiry about the best time to cut cane for the silo, I would say don't cut it for the silo at all. Summer before last I was little short of corn, and used some cane to finish filling my second silo. My objection to the silage is that the cattle would not eat it. Even when I mixed it with corn silage most of the cane would be left in the mangers, and I have had the same experience with volunteer cane mixed with the corn.

On the other hand they do eat it with good relish in the form of hay or fodder. I raise a patch every year for hay. I sow it broadcast, the latter part of June or the first of July, aiming to have it get well ripened in time to cut just before the frost catches it. I cut with a mowing machine, and then rake and pile it up in shocks of from one to two tons. Two men can shock about as fast as one man can draw it up with a rake. At this time of year in this climate, it may be shocked green, right after the mower. It keeps perfectly, goes to the feed lot fine in flavor and color, and is eaten up clean. In shocks of this size, cut late in the year, the loss from weathering is very slight, and the amount rejected by the stock is trifling up to, say, March, when alternate freezing and thawing may be expected here.

There may be some stage short of ripeness at which cane will be made palatable silage. I am very dubious about immature feed of any kind, and my limited experience indicates that corn is so much better than cane in the silo, and cane is so good outside the silo that one makes a mistake to plan deliberately for cane silage. H. B. COWLES.

Topeka, Kansas.

Time to cut Sorghum for Silage.

ED. HOARD'S DAIRYMAN:—The best time to cut sorghum is when the seed is about half ripe. Plant your sorghum in same row with corn, about half and half. When your big corn is ready, the sorghum will be ripe enough. You can also plant cow peas in same row. I put up 300 tons last year and it is very fine.

Dalton, Ga. R. W. W.

Johnson Grass.

Farmers who are thinking of sowing Johnson grass should consider the following California opinion before they introduce a grass that may turn out to be an expensive weed. The same properties that make it a valuable grass under some conditions also make it very difficult to destroy.

"And now poor old Johnson grass is an outlaw and liable to get all who harbor it into trouble. A law has been approved by the Governor which makes it a misdemeanor, punishable by a fine of not more than $100 or three months' imprisonment in the county jail, or by both, for any person owning, controlling, leasing or possessing land in the state, to permit Johnson grass to mature and disseminate its seed on such land. It is also the same offense for any person knowingly to sow or disseminate, or cause to be sown or disseminated, any Johnson grass seed upon any land owned or possessed by another, or over or along any roadway, highway, or right of way for ditch purposes, adjacent to premises owned or possessed by him. This is pretty stiff. Evidently the only safe way will be for every one to get rid of Johnson grass—if he can.—*Pacific Rural Press.*

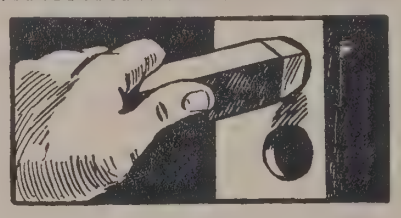
As it Appears in Georgia.

ED. HOARD'S DAIRYMAN:—This is one of the finest countries in the United States. We are 60 miles below Macon, Georgia, which I believe is as far south as Gov. Hoard came two years ago when he visited Georgia, and all we need is HOARD'S DAIRYMAN and some practical dairymen to put the ball in motion. I am advising every farmer I talk with to take HOARD'S DAIRYMAN and commence with a few cows on a small scale.

We started with one cow eight years ago and now have a herd of 75. We use a De Laval separator No. 3, together with other modern equipment for our dairy, and get 30 cents per pound the year around for all our butter, and cannot near supply the demand then.

We have been taking HOARD'S DAIRYMAN for the past six years, to which we owe our success along this line. Our cows are Jerseys and they do well in this climate.

Land is cheap and productive here and very few dairies through this section. We are on the Southern R R., 130 miles from Brunswick, Ga. If you so desire, will let you hear further from us on the dairy question as we advance by the help of your paper, for there is no intelligent dairying without it. I shall be glad to answer any inquiries about this section.



L. M. CURRY.
Manager of Star Dairy Co.
Eastman, Ga.

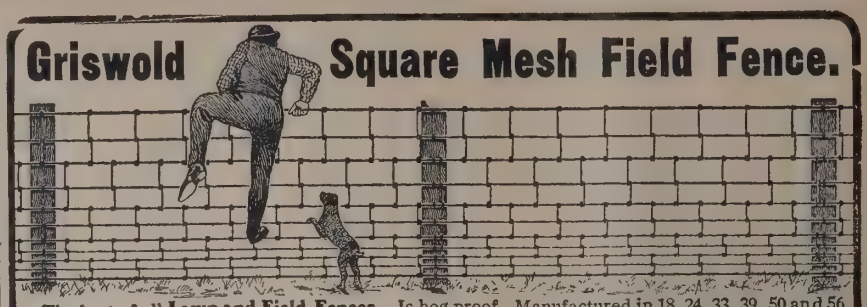
WHEN DID THE CENTRIFUGAL SEPARATOR FIRST APPEAR IN AMERICA?

An eastern subscriber asks the above question. According to our recollection the first separator to make its appearance in the United States was the Danish-Weston. This machine was shown at the International Dairy Fair, held at the American Institute in New York City in 1877-78 and created great interest.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

"The square peg in the round hole" figuratively expresses the use of means unsuited to the desired end. A great many people who have been cured of dyspepsia and other diseases of the stomach and its allied organs of digestion and nutrition by the use of Dr. Pierce's Golden Medical Discovery say: "We tried many medicines with only temporary benefit. It was not until we began the use of 'Golden Medical Discovery' that we found a complete and lasting cure."



$3,000 FORFEIT will be paid by WORLD'S DISPENSARY MEDICAL ASSOCIATION, Proprietors, Buffalo, N. Y., if they cannot show the original signature of the individual volunteering the testimonial below, and also of the writers of every testimonial among the thousands which they are constantly publishing, thus proving their genuineness.

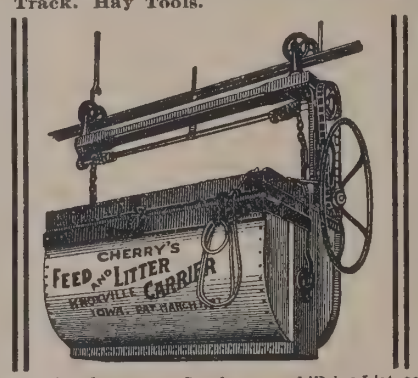
"It is with pleasure that I tell you what Dr. Pierce's Golden Medical Discovery and 'Pellets' have done for me," writes Mrs. T. M. Palmer, of Peede, Kaufman Co., Texas. "Two years ago I was taken with stomach and bowel trouble. Everything I ate would put me in distress. I lived two weeks on milk and even that gave me pain. I felt as though I would starve to death. Three doctors attended me—one said I had dyspepsia, two said catarrh of the stomach and bowels. They attended me (one at a time) for one year. I stopped taking their medicine and tried some patent medicine; got no better, and I grew so weak and nervous my heart would flutter. I could not do any kind of work. Now I can do my house work very well; *am gaining in flesh and strength*, and can eat anything I want."

Accept no substitute for Dr. Pierce's Golden Medical Discovery.

Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 21 one-cent stamps for the paper covered book, or 31 stamps for the cloth bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

Griswold Square Mesh Field Fence.

The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. Plain, Galvanized, Barbed or Telephone Wire. Wire Nails and Hay Bale Ties.** Write for illustrated catalogues and price lists. **Dillon-Griswold Wire Co., Sterling, Ill.**



THE DREW ELEVATED CARRIER
is the cheapest and most practical device for taking away manure from stables, carrying ensilage, feed, grain, etc., etc. No trouble to put them up; no trick to work them; leaves barn yard free from posts; dump in yard or on wagon; turns curves and switches. An inexpensive money saver. Write for illustrated catalogue and full particulars.

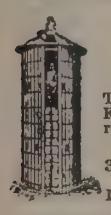
Shoo-Fly THE ANIMALS' FRIEND



Kills every fly It strikes: keeps off the rest. Harmless to man or beast.

This cow was a terror to milk prior to using ½ cents worth of Shoo-Fly. Had it been used earlier, she would not have lost milk and flesh to the amount of $14.00. The other cow was protected early and continued to give 18 qts. of milk daily through fly-time

Shoo-Fly is the original stock protector used by the same dairy-men since 1885, after testing imitations. It prevents contagious abortion and other diseases, cures all sores, scratches, skin diseases, hoof ailments, etc. **NO LICE** in poultry house or any place it is sprayed. Beware of imitations that last only a few hours and make sores. If your dealer does not keep **Shoo-Fly** (made in Philadelphia, Pa.,) send us $1.00 for latest Improved Three Tube Sprayer and enough **Shoo-Fly** to protect 200 cows Cash returned if cows are not protected.
SHOO-FLY MF'G. CO. 1005 Fairmount Ave., Phila., Pa.
EDITOR knows from experience **Shoo-Fly** is O. K.

SILO SENSE
presumes the use of the modern round silo. They are the cheapest and best, and preserve the silage better than all others. THE PLAIN TRUTH ABOUT SHREDDED CORN FODDER.

Dr. Smead, the noted veterinarian, in answering a subscriber of the *National Stockmen* why his ewes and lambs die when they were fed on shredded corn fodder, wheat and oat straw, a little hay and a quart of oats a day, tells him plainly that it is because the food does not afford sufficient nutrition for the strain the ewes are undergoing. The Doctor pays his respects to shredded corn fodder in effect as follows: As a rule the stalks have passed so far beyond the right stage for good fodder that they are "about as digestible as basswood bark."

It does not help poor corn stalks any to shred them. After such a stage in its growth—when the ear begins to glaze—the stalk grows poorer in feeding value every day until it is cut. Then it is left out of doors to the elements and grows worse. Then the farmer shreds it when it is worth a little more than so much brush and seems to think the act of shredding will make it more digestible.

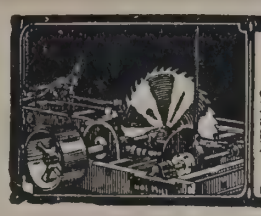
The wise thing to do is to build a silo; cut the corn when it is at the prinnacle of nutriment and digestibility, put it in the silo and thus get the most that can be got out of the corn plant.

Is it not a little queer that nine out of ten men who oppose the silo and talk against it have never tried it? Occasionally a man is found who has given up the use of the silo. He had bad results from it because he did not understand it, but he never tells that side of the story.

To another inquirer whose cow had died from gastric derangement consequent on feeding shredded corn fodder, Dr. Smead says:

I suspect that shredded fodder is mighty poor in quality and produced gastric inflammation or inflammation of the mucous membranes of the digestive tract. Change to some better food and next year build you a silo and put your corn where it should be. Shredded fodder is all right for dry food when it is right, but a whole lot of it is either so dried out before being shredded as to be but little better than wood pulp, or if shredded green it moulds and is sour and not fit to feed. The shredder and husker are all right to husk corn as a labor saver, and make the stalks handle easily, but the silo is the place to keep the corn plant in to make good cow feed. This I say without fear of contradiction.

Washing Separators.

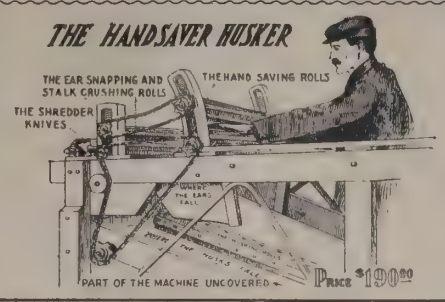


ED. HOARD'S DAIRYMAN:—In looking over, or rather reading, the DAIRYMAN of April 10th, I notice an article written by James Plato where he says that in cold weather he only washes his separator once a day. Now I want to say through the DAIRYMAN that James Plato is making a mistake. A great many young dairymen are reading this paper for profit. It's a bad, very bad, idea to give to them. We are, as a rule, all of us too dirty to make good butter. I always have to watch closely to know that my dairy utensils are perfectly sweet and clean and I would consider it one of the dirtiest tricks to run my milk through a dirty separator. The self-emptying bowl is just as dirty as any other—at least I find mine so, and our cows are all young and healthy cows.

Now let me say for the benefit of young dairymen, and especially the one that takes care of the washing of the utensils, you cannot be too clean, and always use boiling water to rinse with, and under no consideration run your new milk through a dirty separator.

If Mr. Plato wants to lighten the women's work, which I honor him for, let him wash the separator himself once a day; I am quite sure he will save some cream by it too.

Yours for cleanliness and profit.
MRS. F. T. HALL.
Hillsdale, Wis.



Mrs. Hall repeats the constant contention of HOARD'S DAIRYMAN that not separators alone, but every milk utensil should be thoroughly cleansed every time it is used, for one can never be quite certain that there may not have been some lurking contamination in the milk which would develop very markedly from one milking to another.

Grit

Grit is a good thing in its place, but a bad thing in butter. Gritty salt—salt that's icy, insoluble, full of lime, chlorides and magnesium, is accountable for many exasperating difficulties of dairymen. It represents a loss of time, labor, money and patience, not always attributed to it. With DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—your butter difficulties will disappear, and a gain in time, *money* and less labor result. Its dry, pure flakes dissolve quickly, imparting a rich flavor and keeping quality that find ready favor and highest market prices. "Just Salt" is a valuable booklet every dairyman should read. We send it free.

THINGS ON THE McCormick

that appeal to every practical farmer are the improved needle and simple knotter. There are only two moving parts to knotter, and this partly explains why the McCormick is always in working order. The simple knotter is made of extra hardened material that insures long wearing and means long life for the binder.

The McCormick needle is fitted with steel rolls in both the point and heel. These rolls prolong the life of the needle and facilitate the good work of the machine.

The improved needle, simple knotter and other good features will be fully explained if you will call at the nearest McCormick agency.

Ensilage Cutters "They Throw and Blow." Pneumatic. "Silo Fillers." **Blowers.**

These machines cut and elevate with the same wheel at the same time. This wheel has paddles which throw and fans which blow. Without the fans the paddles would throw the ensilage 15 feet high. A light blast of air in addition will blow it to any height. No chains, belts or cogs to slip and waste power. A two-horse tread power will cut and elevate 4 tons per hour, a 10 h. p. engine 20 tons per hour. The easiest running and safest cutters and blowers made. Also cutters and carriers, shredders, silos, engines, horse powers, saw machines, etc. Send for catalogues.

The Covered Milk Pail.

Experiments at Storrs, Conn., Indicate That Its Use Would Greatly Advance Quality of Dairy Products.

The Storrs, Conn., experiment station has just issued a report (Bulletin 25) on the experiments that were conducted there, comparing the use of a covered pail in milking with the ordinary open pail. The covered pail in this case is one modeled on lines somewhat similar to the H. B. Gurler sanitary milk pail illustrated in the Creamery Patron's Hand Book. It is an ordinary milk pail with a tight cover, leaving a funnel shaped opening four inches in diameter, over which several layers of cheese cloth are loosely held by a tin ring that is slipped inside. The cover is easily removable to allow washing the pail inside.

The results had briefly summarized as follows:

1. Two sets of tests were made. In one case, milk drawn into an open pail was compared with milk drawn into a pail with a cover devised for excluding dirt during milking. In the other case, milk drawn into an open pail compared with the same milk strained immediately after the milking.

2. The amount of dirt in the milk from the covered pail was only 37 per cent of that in the open pail, while the amount of dirt in the strained milk was 53.4 per cent of that in the milk not strained. In other words the cover excluded 63 per cent, while the strainer removed less than 47 per cent. The differences in the two samples varied more widely in the latter test than in the former. In the strained milk the amount of the dirt removed depended largely upon the nature of the dirt.

3. By the use of the covered pail an average of 29 per cent of the total number of bacteria and 41 per cent of the acid producing bacteria were excluded from the fresh milk. By straining the milk as soon as drawn into the ordinary open pail, an average of but 11 per cent of the total number of bacteria and 17 per cent of the acid producing species were removed.

4. After the milk had stood for fifty hours at a constant temperature of 70° F. the samples from the covered pail contained a smaller number of bacteria in the majority of the tests, than did the samples from the open pail, yet the covered pail sample frequently contained the larger number. In each test the number of acid producing bacteria was smaller in the sample from the covered pail. In the strained milk, both the total number of bacteria and the number of acid producing bacteria was larger than in the milk not strained. While the data at hand will not warrant any positive conclusions, yet it is probable that the larger numbers in the strained milk are due to the rapid growth of certain species not removed by straining, which are able to develop more rapidly because of the removal of certain other species which if present would antagonize their growth.

5. The milk from the covered pail usually curdled somewhat sooner than that from the open pail, the average difference being about seven hours; likewise the strained milk in most cases curdled sooner than the milk not strained, the average difference being also about seven hours.

6. The fact that the keeping properties of the milk were not increased is of a little practical value, since the milk used in these tests kept on the average nearly two and one-half days at a constant temperature of 70 degrees before curdling. This means that it would have kept for about five days had it been kept at the usual temperature for handling and marketing milk. This is considerably longer than milk is ordinarily required to keep.

7. The demand of the public at the present time is not for milk which will keep for a greater length of time, but for that which can be used as food without danger to health. It is an acknowledged fact that large numbers of children, especially in our cities, die each year of cholera infantum, or of other intestinal troubles, which are caused by certain species of bacteria taken into the system in the cow's milk. The species of organisms which cause these troubles naturally inhabit the filth of the stable and it is highly probable that the exclusion

QUALITY ELMCO MARK

Elmco Feed Leads.

(E)very dairymen or feed dealer is interested in buying that grade of feed which WILL PROVE IN USE the most economical, i. e. profitable.
(L)et any enterprising feed dealer show by test that the product he sells is ALWAYS uniform and of superior quality and his trade will continue to grow.
(M)ore money will come to him on account of larger trade.
(C)areful, systematic feeders find increased profits through getting more CREAM and FAT per ton of superior quality pure feed.
(O)n this basis of quality rests the foundation for our immense ELMCO Feed trade.
See that every sack bears our quality mark, ELMCO.

453.86 lbs. Butter Fat in One Year.

The Largest Official Butter Fat Record of a Two-Year-Old Heifer in the World.

The Guernsey heifer, Dolly Bloom, No. 12770, A. G. C. C., Adv. R., No. 40, has just completed a most wonderful year's milk and butter fat record. This record has been made under the rules and conditions for the Advanced Register of Guernsey Cattle which requires the supervision of an Agricultural Experiment Station. In this instance a representative of the Massachusetts State Station, saw and sampled the milk of this cow each month, and reported the results thus obtained. The inspector also reported various weighings of milk as check weights. The owner reported the detailed weights of milk for each day and statement of feed and care.

Dolly Bloom calved March 22d, and started her record March 26, 1902 when 23 months old and completed it March 25, 1903. During this time she gave:

1902.	*Lbs. milk.*	*% butter fat.*	*Lbs. butter fat.*
March 26 to 30.....	149.00	4.25	6.33
April.	795.50	4.25	33.81
May.....	869.63	4.56	39.66
June.....	909.81	4.40	40.03
July.....	846.69	5.23	44.28
August	795.25	5.17	41.11
September.	703.19	5.60	39.38
October.....	688.50	5.30	36.49
November	691.44	5.55	38.37
December	694.50	5 60	38.89
January.....	641.63	5.80	37.21
February.....	543.69	5.73	30.61
March 1 to 25.....	512.75	5.40	27.69
Total....	8841.58	5.13 av.	453.86

The requirement for the admission of this cow to The Advanced Register was 6,000 lbs. milk and 250 5 lbs. butter fat. Her production greatly exceeded this requirement. The record made is the largest record of a year's production of butter fat by any two-year-old heifer in the world, that can be found recorded and at the same time supervised by any representatives of a public institution or an organization.

The following statement from the owner as to the daily feeding of this cow during her record will be of interest:

March, 1902. After calving, her feed for the rest of the month was gradually increased until it reached 5 lbs. shorts, 15 lbs. ensilage and clover hay *ad libitum*.

April. 6 lbs. shorts. 1¾ lbs.old process oil meal, 1¾ lbs. gluten, 20 lbs. ensilage and clover hay *ad libitum*.

May. Same grain as in April with the addition of 1 lb. corn meal, clover hay until the 15th, when she was turned to pasture and fed peas and oats in the barn.

June. Same as in May except green clover in place of the peas and oats,

July. August and September. Same grain, with the omission of the corn meal. Pasture and green clover continued.

October. Same grain. For coarse food, in addition to the pasture, millet and a little clover hay was given.

November to March. Same grain, 20 lbs. ensilage, 40 lbs. roots (mixture of 1 lb. carrots to every 2 lbs. mangles) and clover hay *ad libitum*.

During the summer she was turned out in pasture until heat of day,and at noon was fed green stuff in the stable. If weather was hot she was turned out at night and stabled in day time. She had the same care and feed as the other cows of her age in the herd with regard to general way of handling. She was milked only twice a day and stood in a standing stall.

Dolly Bloom was bred by Mr. Ezra Michener, of Michener, Pa., and dropped April 14, 1900. Her sire was Divan 5846, and her dam Questa 11385. Their breeding goes back to such noted animals as Bonny Boy, Fernwood Lily and Imp. Pacific.

Dolly Bloom is owned by Mr. F. Lathrop Ames, of Boston. Mr. Ames takes great pride in his small but choice herd of Guernseys at his beautiful estate, "Langwater" in North Easton, Mass., and the work of this cow is a great pleasure to him.

This heifer bears unquestionable testimony to the capabilities of a Guernsey cow. She is one of forty Guernsey cows that have made official yearly records of butter fat and has been admitted to the Advanced Register—the records varying from 296 lbs, to 602 lbs. (equivalent to 346 and 702 lbs. butter.)

Note and Comment.

Factory Co-operation in Canada.—A Warm March in Ohio.—Manure Under Cow Stables.—The Dual-Purpose Cow.

ED. HOARD'S DAIRYMAN:—When one wants to encounter the most advanced and unique thought, they must needs go to Brockville, Ont. The illustration? the group or syndicate plan of factory co-operation, with Dan Derbyshire as its exclamation point! There may be Wittens and Murphys and Eagles, but easily Daniel towers above them all. Not only is he tall, but he is at the same time far reaching. Witness, how he was the first to reach into the public treasury, and his hand was not staid, and monitory help came to the Eastern Association,to better the cheese making of the province by grouping factories, and having a trained instructor to visit these factories and tone up things; and now this same Daniel is lifting up his voice and crying aloud that the factories in the eastern section, more than 200 of them, shall be grouped into some ten, or more syndicates, and the plan of making in each, shall be made as uniform as one Superintendent can devise, the scale of competence raised, the effort made to so better the conditions that the cheese in the Canadian sections shall become so fine, that the people will want to consume them at home, and thus find a better market than abroad.

True, this would be a close imitation of the cheese situation in the states. Once we sold all our cheese abroad and millions of pounds of butter annually, but when the new ideas of manufacture were put into practice, and better produce was made, Uncle Sam's people quickly drank up a great share of the milk and consumed the whole of the butter and cheese, and are actually now importing millions of dollars worth of fine goods to make up the demand from our own people. True, we have no one anywhere a near approach to Derbyshire as a leader in the States, but we have in some way managed to raise the standard of excellence of our dairy produce to a point where it is now virtually all consumed here, and a shortage so great that the demand for butter and cheese from the local trade, is up to the chnrn, and not a month away from the hoop,

Seriously, that plan of grouping the factories of Ontario, and having a uniformity of rules, regulations and high attainment in manufacture in each locality, and a directing instructor, is a fine thing. In a way that is attained in the states by proprietary ownership. Like the dozen Hoard creameries in Wisconsin, the Eldridge 20-factory ownership in Ohio, and four or five other concerns as large, and the syndicate holding of large systems of factories in New York and other places. Whether we are pleased or not, the facts are that the era of centralizing dairy operations in some form is here, and more "a-comin." Of course the Canadian plan will be to act as a unit in sales, and all that appertains to the running of a group, and we prophesy to the increased profit of all concerned and reflect great credit upon its originator, Mr. Derbyshire.

***

The warmest March "in the memory of the oldest inhabitant," a March without snows, and few freezing nights, made the fields the first April days as green as mid-May, and feed in them quite a picking." It was wonderful to notice the knowledge or instinct displayed by the older cows. The sight of the green fields tantilized them, as they looked pastureward through the meshes of the wire fence of the yard. Now and then a cow would life up her voice with that intonation peculiar to breaking-into-your-neighbor's-cornfield, and every cow would point her nose to the southeast and tell *me* that the pasture lay in that direction. Then they went on a starvation strike. The hay they would not eat, and the silage gingerly at best. Some of the ring-leaders demanded what silage they did eat should be half meal. Then we arbitrated. They might go into the little four acre night pasture if they would eat their silage good, night and morning, and no more back talk. This carried. The next night it grew cold, and in the morning it was snowing and blowing a gale and below freezing. Did these cows want to go out? No, they ate their silage with a vim, and then lay down as if green grass and summer skies had faded from their memories. Yes, cows do know a whole lot, and have their ways of making it known; and the next cow census you have taken, Mr. Editor, please get the cow's opinion of her owner; to go with the rest of the "guess."

***

One of the things that I cannot understand is the tenacity with which the New Englander sticks to the inherent plan of a manure basement under his cow stables, and having hogs work over this accumulating mass of manure. Under what processes can there be any additions to its value as a fertilizer? The claim is made that the snow is too deep in the winter to draw direct from stable to field, and yet in Wisconsin, Michigan, and Northern New York, the snow is as deep and lies on the ground as many months, and there, the plan of daily drawing manure is the most largely practiced.

While there are a few exceptions, the general finding is that the smell in the stables over the manure basements, and the working hogs is very pronounced, and in some cases monumental; and cows living in such an atmosphere of escaping odors can hardly be expected to give milk of the most healthy character, if all we are being taught about germs, bacteria, ferments, bacilli, with all their relatives, near and distant, is, the half of it, an actuality.

That storing manure is the *best* way, makes one to doubt the long and painstaking experiments of Roberts, Voorhees, Hunt and others, who show in figures, that the loss of stored manure is from 10 to 60 per cent, which is greater than can take place in the field, by direct drawing from the stables. What puzzles me is this: If manure does wash away in the winter fields, then at what time of year can it be applied when there will be less loss, and when is Dame Nature least extravagant in her wastes?

***

I notice that Prof. Plumb, our new Ohio Professor of Animal Industry, is discussing the problem of the dairy *vs.* the dual-purpose cow, and thinks in some sections the latter is gaining favor, but "beef is being promoted at the expense of milk," which is true. I am convinced that there is a class of cows, a sort of between and betwixt the two classes mentioned,that are neither one nor the other, while being classed as duals. They are duals to the extent that they eat a man out of house and home, and give neither milk nor beef enough to pay their board. This leaves their owner a specialist, as he has only milk to sell, for the beef made on the cow cannot be appropriated without killing her,and so this owner keeps her on, and the only dual-purpose in sight is to sell what little milk she gives and borrow the money with which to buy her feed.

The leaning towards beef-making in the dairy sections is explainable, and that on the ground of the growing scarcity of getting help, which has actually in the dairy sections attained to the proportions of a famine. Help who will work on a dairy farm and be compelled to milk are about unobtainable, and when they can be had the wages they demand are about prohibitory. Many dairies in Ohio are being sold off the farm for no other reason. On the great plains of the far west and the great corn states I doubt if the dairy is to be made popular to the extent of dairying with the distinctive dairy breeds. The only contention is, that in the Herefords, the Short-horns, the Aberdeens, and the like, so called beef breeds, the cows giving some milk and the purpose to make beef,and not say we are dairymen, but farmers, and dairy breeds are not suited to our purpose. There is no instance where dairying has attained far fame where beef and some milk has been the desire. There is too much dust by far being thrown by certain parties, their object being to so obscure the vision that a man will class cow ownership as dairying, and thinks he is securing the best of dairy profit whether he was milking a mountain of flesh into a pint cup, or a bony, fleshless cow into a 14-quart pail. It is an attempt to prove a proposition by comparing unlike things.

***

There was a great shifting in position among the dairymen about here the 1st of April, and there was a great withdrawal of city patronage, and going to the factory instead. The local factory offered $1.15 per hundred for milk and it about broke up shipping. The city buyers paying about $1.40, out of which the railway gets 17 cents per hundred for shipping. The factory takes all of the milk and the city takes it all, if they send

back the cans every time. Some of the trolley roads have advanced rates to two cents a gallon for carrying, and they have lost most of the business. The market here is bare of both cheese and butter, and the books are filled with orders that the makers are unable to fill. This is a bad condition of things surely (?)

Ohio. JOHN GOULD.

Testing Dairy Cows in Illinois.

[By Prof. A. J. GLOVER of the Illinois Agricultural College.]

ED. HOARD'S DAIRYMAN:—The cow census work which has been carried on by HOARD'S DAIRYMAN for the past few years, in the different states, has suggested the importance of showing the dairymen the great difference in individual cows.

For over a year the Department of Dairy Husbandry of the University of Illinois has been conducting field work among the dairymen of the state. A number of them were persuaded to weigh and sample each mess of milk a sufficient number of times during the year, so that the performance of every cow could be estimated. It has been demonstrated by a number of our experiment stations that many cows are kept in the dairy at a very small profit, and some at an actual loss. In order to have the dairymen realize this fact, a man was sent into the field to secure a number of them to keep a record of every cow in their herds. The records which have been collected, bring the farmers face to face with the facts that exist upon their own farms. It shows them that some herds are kept at a good profit, some at a small profit, and others at an actual loss.

HOW THE FARM TEST WAS MADE.

The farmers who took up this work, were required to weigh and sample the milk from each cow in the herd, every seventh week, for fourteen consecutive milkings. After each cow was milked the milk was poured into a weighing pail, weighed, and the weight recorded on a milk sheet directly under the cow's name. A small sample of milk was then taken with a small sample dipper, or a milk thief, and put into the sample bottles. Corrosive sublimate tablets were used to preserve the samples of milk. Instructions were given to each man to shake the composite samples each day so as to mix the fresh samples with the rest of the milk and keep the cream from becoming dry or hard on the sides of the bottle. The jars that were used for keeping the composite samples were one pint, tin top, covered bottles. When the period of weighing and sampling was completed, the samples were tested on the farm, or taken to the creamery to be tested.

MILK SHEET.—ARRANGING APPARATUS.

A considerable amount of time can be saved by arranging scales, sample bottles and milk sheet in such a way that the weighing, recording the weight of milk, and sampling of the milk can be done with few steps and motions. After the most desirable place in the barn has been chosen for weighing and sampling, the scales can be suspended from the ceiling so as to hang very near the milk sheet, which can be tacked to a board and hung on the wall or fixed on an inclined shelf projecting from the wall. The sample bottles can be arranged on either side of the milk sheet, or if convenient, above it. If there are two or more milkers, the sample bottles can be arranged so that each milker will have his bottles together and arranged in the same order that the cows are milked. This method saves time in finding the right sample bottle.

TIME CONSUMED IN WEIGHING AND SAMPLING.

The length of time required in weighing and sampling the milk depends entirely upon the quickness of the man who is doing it. Some men will say that it takes but little time to weigh and sample each cow's milk, while others complain of the length of time necessary to do the work. On the whole, it will take about 1 minute to each cow, 2 minutes a day, 14 minutes a week, or for the seven weeks that it is done during the year, about 1 hour and 38 minutes. With this amount of time expended, the farmer can have a complete record of every cow in his herd. He will know at the end of the year whether she has been a profit or a loss to him, and furthermore, he will know from what cows to select his heifers for his dairy. Considering the time that is consumed to do this work, it seems strange that more dairymen do not have their herds tested in some way. Many of them can weigh and sample each cow's milk every seventh week, and then have the buttermaker test the samples for them at the creamery. Together with the per cent fat and the weights of milk, they can estimate for themselves the performance of every cow in their herds. The importance of doing this work will be shown in the following articles.

CALCULATING THE AMOUNT OF MILK AND BUTTER FAT.

The milk was weighed and sampled during the 4th week of the 7-week period. With the total amount of milk that each cow gives during this time, and the per cent of fat, is calculated the amount of butter fat produced in the week. From these results were estimated the amount of milk and butter fat each cow produced three weeks before, and would produce three weeks following the test. The cow's yearly record was made up from these tests and in this way the total amount of butter fat each cow produced during the week. From these results were estimated the amount of milk and butter fat each cow produced, three weeks before and three weeks following the test.

The Dairy Department of the Wisconsin Experiment Station had their patrons weigh and sample one day each week during the whole year. From the different weights and tests they estimate the amount of milk and butter fat that each cow produced in the entire year. The testing of the milk each week is too much for the average farmer to do, but taking composite samples of milk of several milkings gives a very good average of the per cent of fat contained in the milk, and can be done by any one if he chooses. Fairly accurate results can be obtained by weighing and sampling the milk every 13th week and calculating the results the same as when the weighing and sampling were done every 7th week.

The method of weighing and sampling each cow's milk every 7th week, for 7 consecutive milkings or 3½ days, gives very good results. The results can be multiplied by 2, which would equal the amount of milk and butter fat produced for one week, then estimated the same as if weighing and sampling were done the entire week. The composite samples that are but 3½ days old are usually in better condition for testing than samples that are a week old. It was found also that farmers will take more pains with the work if it does not become tedious to them. The accuracy of records obtained by weighing and sampling each cow's milk at regular times during the year, may be doubted. In comparing the amount of milk and butter fat sold from two farms to a creamery, with the amount of milk and butter fat that was determined from the weighing and sampling of each cow's milk every 7th week for 14 consecutive milkings during the year, it was found in one case a difference of 2.2 per cent of butter fat, and .0015 per cent in milk, or making a difference of 4.67 lbs. of butter fat and 8.09 lbs. of milk per cow; in the other case a difference of .038 per cent fat and 1.98 per cent in milk or, .27 lbs. of butter fat and 120.3 lbs. of milk per cow. I am fully convinced that by taking pains in weighing and sampling, valuable records of the dairy herd can be obtained by weighing and sampling each cow's milk every 7th week during her period of lactation.

SAMPLE OF MILK SHEET FOR KEEPING WEEKLY RECORD.

MILK RECORD FROM JULY 30 P. M. TO AUGUST 6 A. M.

NO. OF MILKINGS.	Spotty No. I.	Black No. I.	Black No. II.	Bottle.	Milly.	Little Lamie.	Alice.	Belle.	Sleepy Eye.	Roamey.	Pet.

APPARATUS.

The things which were necessary for carrying on the work were: a spring scale for weighing the milk; a small dipper or milk thief for taking the samples; bottles for holding the composite samples; corrosive sublimate for preserving them, and milk sheets; all of these were furnished by the experiment station. Each cow was given a name or a number which was placed at the top of the milk sheet so that the weights of milk could be put directly under it; her name or number was placed on the side of the composite sample jar, which was used for holding her sample of milk. The following milk sheet shows the arrangement of the cow's name, and the weights of milk placed below it, together with the per cent fat in the milk and the total amount of fat produced by each cow in one week.

THE DIFFERENT METHODS THAT MAY BE USED IN WEIGHING AND SAMPLING.

There are several ways that records from each cow in the dairy can be obtained The method used in obtaining the records which will be given in future letters were as follows: The farmer every 7th week, weighed and sampled each cow's milk for 14 consecutive milkings. The amount of milk yielded each day was added together and from the per cent of butter fat which the milk contained, milk and butter fat that she produced during the year was determined. In many cases the dairymen kept an approximate account of all the grain and roughage that each cow consumed during the year. Where this is done, the records are more valuable, for they clearly show the profit or loss of every cow kept in the dairy.

OBJECT OF THE WORK.

There is no better way of finding out the merits of a dairy animal when giving milk than to use the scales and the Babcock Test. With the weights of milk produced, the per cent of butter fat in it, and the length of her milking season, together with the food consumed, the value of a cow for the dairy can be determined. The object in getting the dairymen to do this work is to determine which of the individual cows in their herds is the most profitable, so that the owner may cull out his poor cows and keep only his profitable ones; to show them the importance of better feeding and caring for their stock, and the importance of selecting better sires for their herds. A dairy animal should be selected for the amount of milk and butter fat which she yields during the year, rather than on points of fancy or form. It is a pretty safe rule in selecting dairy cows to go upon the results obtained from the scales and Babcock Test. The

safe way to know the true merits of a dairy cow is to have a record of the products she yields in one year. If she is a good breeder, that also should be taken into consideration. If the performance of each cow in the herd is known, the heifers can be selected from the best cows and when these heifers become fresh the test can be applied to them and the inferior ones culled out. This can only be done when we have an intelligent understanding of each cow and her capability of producing milk and butter fat.

ELEMENTS OF DANGER IN THE USE OF SCALES AND BABCOCK TEST.

While the scales and Babcock test can be of great service in the selection of our dairy animals, they must, however, be used with judgment. Dairy cows will have their "off years," and this must be considered when the herd is being culled. If we do not bear this fact in mind, we are apt to sell some of our best cows from our herds. The writer has in mind the cow "Sweet Briar," of the Minnesota Experiment Station, that produced for ten years an average 358.07 lbs. of butter a year, while, in 1898 she produced only 206.62 lbs. of butter, but in 1899 she made 306.53 lbs. of butter, and in 1901 she yielded 370.53 lbs. of butter. If the merits of "Sweet Briar" had been wholly based upon the work she did in 1898, she would have been classed a very ordinary cow, and perhaps sold. The great value of scales and Babcock test lies in their continued use in the dairy herd, and not in one year's test. Good heifers usually come from the best cows, but it happens that a promising heifer may do very poorly the first year. In such cases the heifer's individuality, together with her breeding should be considered before she is sold. The testing of cows should, however, be carried on in every dairy, if a systematic selection of the dairy is to be made. A good cow seldom has two "off years" in succession.

THE VARIATION IN FLOW AND PER CENT OF FAT IN MILK.

It has often been asked why it is necessary to weigh and sample each mess of milk for a week. By weighing and testing each milking separately, we usually find considerable variation in milk yields and fat content. The following table shows to what extent a cow will vary in milk yield and per cent of fat from one milking to another.

TABLE SHOWING THE YIELD OF MILK AND PER CENT BUTTER FAT OF EACH MILKING FOR ONE WEEK.

MAID CLOVERDALE'S RECORD.

1901.	Lbs milk.	Per cent fat.	Total fat for each milking.	Total lbs. milk.	Total lbs. fat.
Sept. 23rd, Morning	18.1	2 8	.506		
Noon	11.5	3.0	.471		
Evening	15.7	3.0	.471	45.3	1.322
Sept. 24th, Morning	18.4	4.2	.772		
Noon	13.0	3.1	.403		
Evening	15 6	2.6	.405	47.0	1.580
Sept. 25th, Morning	16.7	2.0	.334		
Noon	16.4	3.3	.541		
Evening	13.4	2.8	.375	46.5	1.250
Sept. 26th, Morning	20.4	2.6	.449		
Noon	18.0	4 5	.810		
Evening	11.9	2.4	.285	47.2	1.544
Sept. 27th, Morning	20.4	2.7	.550		
Noon	14.5	2.9	.420		
Evening	15.2	2 8	.425	50.1	1.395
Sept. 28th, Morning	18.5	3.8	.703		
Noon	14.5	2 8	.406		
Evening	14.5	2.3	.333	47.5	1.442
Sept. 29th, Morning	20.9	3.2	.668		
Noon	14.3	2.4	.343		
Evening	15.9	3 0	.477	51.1	1.489

The above table readily shows the importance of weighing and sampling the milk for more than one milking, if the average test of the cows is to be obtained. It will be observed that Maid Cloverdale tested on the morning of September 25th, 2 per cent, and at noon, September 26th, 4.5 per cent. If at either time a test had been made for the purpose of obtaining her actual per cent fat it would have been entirely wrong, for her average test for that particular week was 2.99 per cent.

THE BASIS UPON WHICH THE PROFIT OR LOSS OF THE COW IS COMPUTED.

It is very difficult to express the true value of the dairy cow in dollars and cents. But since the profit or loss of most of the cows tested has been given, it is perhaps well to state the basis upon which the profit or loss was calculated. The value of the product that the cow yielded was based upon the amount of butter fat that she made, and the market price of butter fat at the time.

The value of the skim milk, the value of the calf, and the value of the manure produced by the cow were not credited to her, while on the other hand the cow was not debited with the amount of labor expended in her care nor the amount of feed consumed when dry. The cow was simply credited with the amount of butter fat she produced, and charged for feed consumed when she was giving milk. The calf will usually pay for the cow's board when dry, and the skim milk for the labor it takes to care for her. This method of calculation is perhaps a little unjust to some cows, for it is possible to have two cows yield the same amount of butter fat and one give a profit and the other a loss. If, for example, one milks ten months and the other milks but six months in the year, to yield equal amounts of butter fat, which sometimes happens, one cow is charged with ten month's feed and the other with only six months.

"Red Bird" in Herd "B" and "Duchess" in Herd "C", (whose records will be reported later) are examples of this kind. "Red Bird" milked ten months and charged a loss of $1.28 for her board, and "Duchess" milked six months and gave a profit of $9.16, and each yielded the same amount of butter fat.

The average prices for butter fat from Sept. 1st, 1901, to Sept. 1st. 1902, when sold to creameries, were as follows:

September	19 cents.
October	19 "
November	20 "
December	22 "
January	24 "
February	28 "
March	25 "
April	26 "
May	22 "
June	21 "
July	20 "
August	19 "

The average prices of grain and roughage from Sept. 1st, 1901, to Sept. 1st, 1902, were about as follows:

GRAIN.

	Per Ton.
Bran	$18.00
Shorts	18.00
Corn meal	20.00
Corn cob meal	20.00
Grano gluten	18.00
Gluten meal	28.00
Gluten feed	22.00
Oil meal	28.00

ROUGHAGE.

Clover hay	10.00
Timothy hay	10.00
Millet hay	10.00
Corn stover	4.00
Corn silage	2.00

Pasture, $1.00 per month.

The price of grain is based upon purchase price in the city market and the price of roughage is based upon the purchase price at the farm. When the cow is charged the above prices for farm products the farmer receives a profit on his land, and the profit which the cow gives him is over and above what he could have received for his products if he had sold them upon the market, and moreover, he has retained most of his soil fertility in the form of manure.

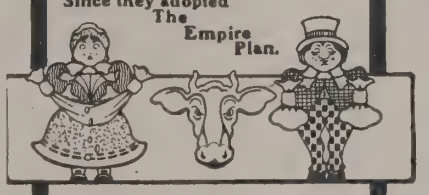
A LAST RESORT.

Pure Food Should Be the First.

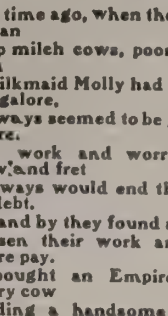


When the human machine goes wrong it's ten to one that the trouble began with the stomach and can therefore be removed by the use of proper food. A lady well known in Bristol, Ontario County, N. Y., tells of the experience she had curing her only child by the use of scientific food: "My little daughter, the only child and for that reason doubly dear, inherited nervous dyspepsia. We tried all kinds of remedies and soft foods. At last, when patience was about exhausted and the child's condition had grown so bad the whole family was aroused, we tried Grape-Nuts.

"A friend recommended the food as one which her own delicate children had grown strong upon so I purchased a box—as a last resort. In a very short time a marked change in both health and disposition was seen. What made our case easy was that she liked it at once and its crisp, nutty flavor has made it an immediate favorite with the most fastidious in our family.

"It's use seems to be thoroughly established in western New York where many friends use it regularly. I have noticed its fine effects upon the intellects as well as the bodies of those who use it. We owe it much." Name given by Postum Co., Battle Creek, Mich.

A long time ago, when they first began
To keep milch cows, poor Dairy Dan
And Milkmaid Molly had troubles galore,
And always seemed to be getting more.
They'd work and worry and stew and fret
And always would end the year in debt.
But by and by they found a way
To lessen their work and get more pay.
They bought an Empire, and every cow
Is yielding a handsome profit now.
They're Jolly Molly and Dandy Dan
Since they adopted The Empire Plan.



The Easy Way

is not always the best way, but it so happens in the case of the

Empire Cream Separator

that it is both the **easiest** and the **best.** The Empire runs more lightly than any other separator of the same capacity; it is more easily cleaned, because it has few parts; it lasts longer and costs less for repairs, because it is better built and freer from intricate mechanism. In short, it is the simplest, most efficient hand power cream separator made. We guarantee that it will do better work with less labor and trouble, than any other separator, and all we ask is a chance to let you prove our claims to your own satisfaction. What do you say?

Let us send you our good book on "Making the Dairy Pay." It's free for the asking.

Empire Cream Separator Company,
Bloomfield, New Jersey.
Western Office, Fisher Building, Chicago.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.

Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

THE *Nebraska Farmer*, in answer to an inquiry as to which family of Shorthorn cattle are the best milkers, answers very justly that the milking faculty with Short-horns is an individual, and not a family, trait. Here and there are good milking Short-horns but they are as a rule sports, and do not posess the power of breeding in the milking line. And even if they did there are no Short-horn bulls but what have been bred for generations for beef, and the beefier they are, the more certain they are to suit the Short-horn idea, so it seems the prospect of getting good dairy cattle from the Short-horn must be confined to the female side of the house, and that is very uncertain. Considering that the bull is more than half the herd, the prospect is very dubious.

WORTH READING.

HOARD'S DAIRYMAN has arranged with Prof. A. J. Glover, of Illinois Agricultural College, for a series of letters that will be worth reading by every dairy farmer who cares to establish in his mind and judgment, an intelligent idea of the relation of the cow to the profit or loss of the business, as well as the value of having an intelligent system of doing business with the cow.

Mr. Glover has been in the employ of the Illinois College of Agriculture for three years. His work has been mainly with the dairy farmers of that state in testing their cows and in instructing them in the ways and methods of such work.

Consequently what he says will come from the most practical relation to the actual conditions of the average cow keeper of the middle west.

What HOARD'S DAIRYMAN is after, is a full supply of hard facts. It does not care a fig for theories unless they are forced into existence by undoubted facts. For this reason it goes to any necessary expense to learn what the facts are concerning the men who keep cows; how much brains they put into their business; what is the cash value of brains, and what is the serious cost of ignorance; what is the value of dairy blood and wise breeding for dairy work; what is the best food, and how to feed it and how to grow it, and so on through a long list of things that ought to be better known than they are.

We invite a careful reading of the series of articles which will appear from the pen of Mr. Glover, who is himself a thoroughly trained dairyman in both a practical and scientific sense. His first communication will be found in this issue under the caption, "Testing Dairy Cows in Illinois."

AS MR. TROW LOOKS AT IT.

There is a very encouraging discussion going on all over the country on this question of profit and loss in dairying—what leads to profit and what leads to loss. We are glad the farmers are waking up. There is such a host of them that have been content to go along without thinking or discussing or looking into the matter. Mr. A.W. Trow,the able editor of the Dairy Department of the St. Paul *Farmer*, writes out the subject as follows, under the head of "Annual Gross Returns From Twenty-Two Cows:"

"We are asked to state what it costs us to produce a pound of butter. Our reply is that it costs us all that we get for it. We figure our feed, wear and tear of equipments, use of cows, labor, and the interest on investment, and then we are egotistical enough to appropriate the little that is left to the credit of the gray matter that is capable of making a cow give two pounds of butter while some other fellow's cows are giving a great deal less.

If a man can produce 20-cent butter with an outlay of 15 cents, the balance or five-cent margin belongs to the head that guides the operation. However, we will give this much of our personal experience.

Our cows brought us last year an average of $52.28 for the butter fat sold at the creamery. This, of course, does not include the whole milk fed to the young calves, the milk used in a family of four or five, nor the five cents per hundred taken out after deducting all other expenses of manufacture, to pay for a new creamery. One-half of the calves from these cows were recently sold while at an average age of four months, for $140. This would make the total value of the calves $280. Assuming that the skim milk fed to swine during the year would pay for the grain and hay fed to the calves, we have a total income per cow of about $65, or if the calves were figured at $5 at birth and the skim milk at ten cents per cwt., the total income would amount to about the same. These cows were fed no grain while on summer pasture. Each cow consumed during the feeding season about one ton of hay, and four tons of silage, with about 30 bushels of ground mixed wheat and oats, about one part of the former to two of the latter. A fair estimate of value of feed would be as follows:

Four tons silage	$8.00
One ton clover and timothy hay	6.00
Pasture, per cow	5.00
Thirty bushels ground wheat and oats	9.00
A total cost of	$28.00

This makes a cost of about 9 cents per pound of butter produced, for feed alone. The balance of $37 after deducting feed expense, is by no means all profit, for practically all the work was done by hired labor. The milking, hauling the milk to the creamery and feeding the calves were no small items. We do not believe a dairyman is making a very great profit nor good pay for his labor until he is getting twice as much from his cows as the value of the food consumed."

Note the closing sentence of the above most excellent showing and take it as a tape line to measure, in most any creamery in the land, the opinions and practice of the farmers who patronize it. How many belive as Mr. Trow does? Not one in a hundred. How do we know? Because their talk, their methods, their ideas, and what they get from their cows all show that they don't believe it. Fifty out of every hundred solidly believe that all they should expect is but little more than the cost of the feed, while a large number believe they ought to be content with from 50 to 80 cents less than every dollar they spend in feed. The investigations into their actual conditions show what they believe and as they believe so do they act. Let us get these landmarks of belief and practice established, so that we can make up our minds what an intelligent dairyman thinks he ought to have and works for, and what the other kind are sweetly content not to have.

PUBLIC SALES OF HIGH QUALITY DAIRY CATTLE.

Advertisements in this and recent issues of the DAIRYMAN bear witness to fact that never before have there been such opportunities offered for the professional breeder or the every-day, up-to-date dairyman to secure the choicest specimens of high quality dairy cattle, at prices fixed by themselves. The records of the sales thus far held indicate unmistakably that, while some animals bring what may be termed fancy prices, when professional breeders compete for the possession of bulls or cows of phenomenal notoriety, the great majority are sold at prices well within the means of any progressive dairyman, and some go very far below actual value when measured by dairy ability only. We are much gratified to note in this connection also that more and more dairymen are taking advantage of these sales to introduce new and better blood into their herds.

Among the sales yet to be held, is that of Averill and Gregory at Syracuse, N. Y., June 4th, when their entire herd of some two hundred Holstein-Friesians, of both sexes and all ages, will be sold without reserve. Those who have read the "Official Records of Holstein-Friesian Cows" as published by us from time to time, cannot have failed to note that the name of Averill and Gregory has appeared so often, as owner of cows admitted to the Official Advanced Registry of that breed, as to justify their claim that their herd contains the largest number of officially tested cows in the world.

This is therefore an opportunity which neither breeders nor dairymen can afford to neglect. We realize how difficult it is for the practical dairyman to attend these sales in person, but it is a simple matter and an entirely safe practice to authorize some person to represent them, and submit bids for them under specific instructions, as to price, quality, ect. Send for a catalogue to Yates Hotel, Syracuse, N. Y., or Gregorian Hotel, N. Y.

LAWS WON'T MAKE BUTTER.

In commenting on the clamor of many creamery butter makers for more rigid laws relative to the delivery of good milk to the creamery, Mr. A. W. Trow, of Minnesota, in the St. Paul *Farmer* says:

"It may seem an advantage to some buttermakers to shirk the responsibility of refusing bad milk or cream, and have this responsibility carried by the state, but laws have not the required elasticity nor exceptions. They cannot discriminate on quality. Laws can never step in to take the place of the tact and judgment of a buttermaker. If good milk, good cream, and many other good things could be gotten by making laws, we would now be subsisting on the angelic diet of the millenium, instead of milking cows to make butter. It is as difficult to legislate cleanliness as Godliness into us farmers. Better results will be obtained by politely, kindly but firmly, refusing all unwholesome milk or cream, be it one day or a week old. The greatest requisite to creamery success is co-operation among patrons, directors and butter makers; and the enforcement of drastic laws without great discretion is the quickest way of destroying co-operation.

Three years ago we heard the head man of a new creamery say that the easiest way to get along with a crowd of farmers, was to lay down a set of iron clad rules with severe penalties attached, draw a distinct line and whenever one of them failed to toe the scratch in complying with the rules, to unceremoniously annihilate him. With the aid of this policy it took this man but two years to completely annihilate the creamery.

The farmer will stand coaxing and reasoning but no bluff."

It is almost universally true that those creameries are the most successful that possess butter makers that have a kindly, patient tact and the disposition to get out among their patrons and convince them of the great value of better methods.

MUCH IN LITTLE.

Many things in few words are conveyed in the following conclusions from a hog feeding experiment by the Nebraska Station. Corn, shorts, skim milk and alfalfa were used as foods.

Four lots of hogs of five each, were fed twelve weeks. Lot 1 fed on corn meal alone consumed 587 lbs. each and made a gain of 78.6 lbs. each; taking 7.4 lbs. food for one lb. gain. Lot 2 consumed 585.4 lbs. corn and 117 lbs. skim milk, making a total gain of 132.6 lbs. each and requiring 5.2 lbs. dry matter for one pound gain. Lot 3 were fed corn meal and shorts in proportion of four of corn meal to one of shorts. The hogs of this lot consumed 592.3 lbs. and each gained 101.6 lbs. requiring 5.8 lbs. of dry matter for 1 lb. gain. Lot 4 were fed four pounds of corn meal to one of alfalfa. They consumed 593.5 lbs. each, and made a gain of 161.6 lbs.; 5.8 lbs. of dry matter to 1 lb. of grain. The conclusions of the report are as follows:

Reckoning alfalfa at $7 per ton, shorts at $12.50 per ton, corn meal at $12.00 per ton and skim milk at 15 cents per hundred, the cost of making 100 pounds of gain from corn alone was $4.48; from corn and skim milk $3.97; from corn and shorts $3.53: corn and alfalfa $3.40. The skim milk hogs are reported to have been more hearty feeders, and although they made much the heaviest gains, yet the increased price of the protein when fed in the form of skim milk, considerably increased the cost of making a pound of gain over and above that of shorts or alfalfa. An examination of the carcasses after slaughtering revealed the fact that the alfalfa fed hogs showed much thicker streaks of lean and much thiner layers of fat meat than did the corn fed hogs. The bones of the corn fed and alfalfa fed hogs were tested for strength. One bone from a corn fed hog broke under a pressure of 320 pounds and the other at a pressure of 330 pounds. The same bones from the alfalfa fed hogs supported a pressure of 500 pounds and 520 pounds, respectively, before they gave away.

The hogs weighed 128 lbs. each at commencement of trial.

SOME DUAL-PURPOSE FACTS.

The foundation objection to the dual-purpose idea for dairy purposes is that such cattle are not prepotent in the transmission of dairy capacity to their progeny. The instances of such cows as are so often cited to us as convincing proof of the soundness of the idea, are in fact no proof at all that it is a practicable thing to breed such cattle to a profitable average from the dairy standpoint.

Mr. Frank D. Ward, of Batavia, N. Y., is writing some very instructive articles to the *Tribune Farmer* on "Types in Breeding." We take the following extract from the issue of April 16 to show his experience, and we may say that of thousands of others, in this vain desire to secure a cow that shall bring the largest profit both for milk and beef and still breed true to such mixed purpose.

Mr. Ward says:

"But how does the general or dual-purpose animal compare with those bred for a special-purpose, and which will return the greatest profit during their life on the farm? I well remember some animals I have owned whose merit impressed me forcibly. One of them was a pure bred Short-horn cow, Hope VI, which was bred on the farm and was kept there until she was sold at about ten years of age. She was one of the most perfect types of a beef cow we ever owned, weighing over sixteen hundred pounds, low down and broad, with a back like a

table, and at the same time she was a most extraordinary milker. Some idea of her merit as a beef cow may be gained from the fact that she won first prize as aged cow in the Short-horn class at one of the largest fairs in the state, and at the same fair the next day she won sweepstakes prize as best dairy cow of any age or breed, in both instances having a large class of competitors. But Hope VI never bred a calf that was even an ordinary milker; and as to her dairy qualities, she was simply a "sport," without any power of reproducing the dairy qualities she possessed. In the spring of 1873 I bought two heifers which were typical specimens of dual-purpose cows; they were high grade Short-horns and were the choice from two good herds in Livingston county. I have owned a good many cows, and some good ones, but I never owned two cows that would give as many pounds of milk or butter in a year as they did. They were in my herd eleven years, but during that time I was able to breed only one heifer from either of those cows that was even up to the average as a milk cow, but that was one of the very best cows I ever owned, and she was sired by a pure Short-horn bull.

She was kept in my herd until she failed to breed at sixteen years old, but she never bred a calf that was of any value in the dairy. If I am asked to explain as to these cows, I must say they were other instances of "sports"—cows in which abnormal characteristics were developed, but they had no power to transmit these characteristics to their offspring. It is true that, as individuals, I made money on these cows, and lots of it; but I suppose that in the years I milked them the three cows dropped about thirty-two calves, of which probably fifteen were heifers, and in my desire to secure more cows like the old ones I kept on growing up heifers which were a failure in the dairy, and were sold as second-class beef. Thus they robbed me of all the profit I made on the phenomenal cows that bred them. After balancing some books and doing some hard thinking, I sold all the dual-purpose cows and bought Jerseys for the dairy."

The true purpose of a dairy cow is twofold. (1) To produce milk to the best possible profit. (2) To contain within her the elements of procreation that shall perpetuate and if possible increase dairy quality in her daughter. The dairy sire must have within him the same and indeed more dairy prepotency than the cow or else he is a costly failure.
